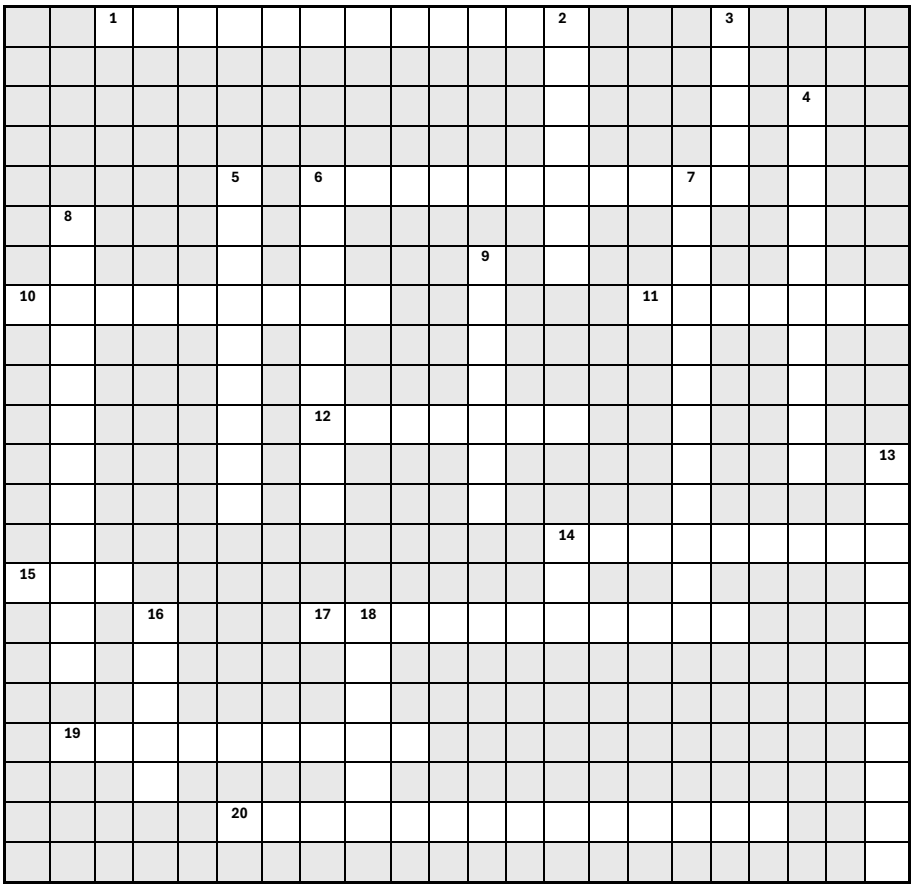
Immunizations & Communicable Diseases



Across	Down
1 Communicable disease characterized by white then red “strawberry” tongue	2 Communicable disease which is the greatest threat to an unborn baby
6 Permanent contraindication to any vaccine	3 Interventions for this communicable disease include soft/liquid foods and warm or cool compresses
10 Temporary contraindication to a live virus vaccine	4 Produced by the immune system in response to a vaccine
11 Vitamin A supplementation may be recommended for a child with this disease	5 History of intussusception is a contraindication for this vaccine
12 Used to stimulate the body’s immune response against diseases	6 Treatment for immunocompromised patients diagnosed with varicella
14 Communicable disease characterized by a vesicular rash which is extremely pruritic	7 Process by which a person becomes protected against disease through vaccination
15 Vaccine responsible for decreased cases of bacterial meningitis in children	8 Spread of disease is stopped when the majority of the population is vaccinated
17 Most effective prevention method for controlling the spread of any communicable disease	9 Type of immunity when antibodies are transferred from an animal or human to another human
19 Disease with respiratory assessment as a priority	13 Type of vaccine which cannot replicate
20 Vaccines which are a weakened form of the “wild” virus or bacterium	14 Required by law to be given with each dose of vaccine
	16 National surveillance system for vaccine safety
	18 Type of immunity produced by a person’s own immune system
