Convergence

I was doing some research between three of the newest and best smartphones, which were Apple iPhone 11 pro, Samsung Galaxy S10e, and the Samsung Galaxy S20+, I found that it is actually hard to not have a biased opinion about phones like most things. This opinion is going to come from a perspective of someone who can afford a great smartphone. With that being said, I had to go with the iPhone 11 pro.

The iPhone 11 pro is very expensive, the range is anywhere from 800\$ to 1200\$, but you are paying for some unique things. The iPhone 11 pro comes with three cameras, which makes the graphics of a picture look like what you are seeing and better zoom capabilities. You also get a longer battery life, if you don't use the phone much during the day, the battery probably last all week, but if you use it like today's normal, then you'll probably have 20% battery life left once you go to bed. The phone has built gps, calendar, notes, and a few other apps that come the phone when you get it. You can download any app you can think of, between work apps or gaming apps.

There are a few cons with this phone, it is very pricy, additional purchases are required, and the next iPhone comes out in the next year, and usually has bigger changes, so hopefully you don't want a new phone every year. With the new iPhones, you have to buy a dongle, a dongle is

something that plugs into the end of your headphones and then plugs into the charging port on your phone so you can listen to music. There is no longer a headphone jack on the iPhones. Most people buy air pods, which are Bluetooth earbuds that connect via Bluetooth, and are expensive as well. Other than that data plan and billing will be setup by you and the phone carrier company that you use service through, These plans vary in service and money.
