Module Assessment 1

Engineering Fund

2. The water is collected from the source(watershed) into collecting works. It then dispatched to the transmission works to the first treatment works (filtration plant). It is then passed the distribution system where some is collected for the reservoir and the rest is sent to other treatment plant for further softening then it is sent to the collection works back to the source (groundwater).
3. Demand is the use of water by consumers. This use of the word derives from the economic term meaning “the desire for a commodity.
4. determine the amount of water than on person uses a day then multiply that by the number of people in the city to determine the average daily water.
5. WWTP-waste water treatment plant, POTW-publicly owned treatment works
