

Computers work by using hardware and software. Computers were made so that they could help us think faster and work faster also helps use simple circuits to do math. For a computer to give you an answer to a question it has to do four things, it has to take input, store information, process information, and output the results. 1 and 0 are a big part of how computers work on the inside. In a computer, wires and circuits carry all the information. One wire represents true, false or yes or no, on or off that. Computers have evolved over time you can basically search anything on the internet and get an answer. Computers also has a brain know as the cpu (central processing unit ). The cpu is the most important part of the computer because it makes it function by sending signal to other parts of the computer. pixels are also a big part of a computer because the pixels make up the pictures and colors that you see. pixels are the smallest part of a digital image. The internet is a network that everybody across the world uses to search things. The internet function by router that sends data through the media. The internet connect computers together globally by doing that everyone across the world can chat or get on websites or do whatever you want.
