

After conducting my research, I am only at risk for the following cancers:

Lung Cancer, as my grandfather die of lung cancer. This puts me at risk as having family history of lung cancer puts you at risk for lung cancer.

Prostate Cancer, while at my age it is unlikely to be diagnosed with prostate cancer. As men age the become more and more at risk for prostate cancer.

Luckily, my research showed I am unlikely to get cancer with the current lifestyle and diet that I follow.
