

Cardiac Assessment Definition Match

____ Thrill	F. Turbulent sounds occurring between normal heart sounds. Characterized by loudness, pitch, shape, duration. Graded I-VI
____ 3 rd Heart Sound	D. Small red streaks under fingernails
____ Troponins	G. HR > 100
____ HDL	E. HR < 60
____ Heart murmurs	B. The amount of blood pumped by each ventricle in 1 min. Calculated by Stroke Volume X HR
____ Splinter hemorrhages	M. Peripheral resistance against which the left ventricle must pump
____ Tachycardia	A. Turbulent flow through artery caused by aneurysm or arterial obstruction
____ Bradycardia	I. Contractile proteins released after MI. Both T and I samples test for cardiac injury/ischemia
____ Arterial bruit	L. Extra heart sound heard in EARLY diastole, similar to the sound of a gallop. Causes include Left Ventricular failure, volume overload, aortic or tricuspid regurgitation
____ LDL	K. Alteration of spine often in elderly resulting in altered chest landmarks, auscultation, and percussion
____ Cardiac Output	C. The volume of blood stretching the ventricles at the end of diastole before the next contraction
____ Kyphosis	H. Vibration of vessel or chest
____ Preload	N. Lipoprotein considered to be the “good cholesterol”
____ Afterload	M. Peripheral resistance against which the left ventricle must pump
____ Cardiac Output	J. Lipoprotein considered to be “lethal cholesterol”
