

Part 1 – How does A/C work when the pt. initiates breaths while in this setting?

Part 2 – Under what circumstances would it be appropriate to hit the 100% FiO₂ instead of placing them back on A/C if weaning off the vent?

Video 3 – How do the high and low for V/Q work if one or the other is low? What is an A-a gradient?

ABGs – How does the body compensate for low or high pH values?
