

## Part One

We can determine that the pest is eating away at the crop and leaving behind a brown residue. The plant is chewed, and the pest ate a lot of the top part of the plant, as well as eating away at the leaves.

### Hypothesis:

Noting the eating of the corn plant and the brown residue left behind we believe that pest is the Armyworm.

### Arguments:

- Chewing of the leaves
- Brown residue left behind on the plant
- Visual of the work itself

### Damage
