

Project 4.3.1 The Story of Water

Water travels in the ecosystem. There are five locations of water and they are organisms, precipitation, surface, atmosphere and ground water. There are three different forms of water gas, liquid, and solid.

I am an ice crystal in a cloud high above the mountains north of Fruitvale. I am a solid in the **atmosphere**.

I am a snowflake falling down in the mountains north of Fruitvale. I am a solid in **precipitation**.

I am in a snow pile in the mountains north of Fruitvale. I am a solid on the **surface**.

I **melted** and now I am in an underground river running under Fruitvale. I am a liquid in **groundwater**.

I got soaked up by a plant's roots and I am flowing through the stem of the plant. I am a liquid in an **organism**.

The plant dried up and now I have **evaporated** and I am water vapor rising in the warm air. I am a gas in the **atmosphere**.

I started in the atmosphere and then I fell down in precipitation. After that I was on the surface and then I was in an underground river. I got soaked up by roots and then I was in a plant's stem. After that the plant dried up and then I evaporated and I turned into water vapor.
