<p>1. Disease Process & Brief Pathophysiology (Identify Key Concepts to Your Patient and Include Reference): At the level of the cell nucleus, both positive and negative regulators of growth are necessary for normal control of cell proliferation. Excessive production may occur that converts proto-oncogenes into oncogenes, resulting in significant neoplastic growth. The loss of tumor suppressor genes by mutation, deletion or reduced expression aids in the conversion of normal cells to malignant phenotypes. The excessive stimulation of proto-oncogenes and lack of inhibition of oncogenes lead to neoplastic proliferation. As the tumor grows edema develops.</p>	<p>2. Factors for the Development of the Disease/Acute Illness: Unknown cause A genetic loss or mutation Prior cranial radiation exposure</p>	<p>3. Signs and Symptoms: irritability drowsiness Headache imbalance nausea vomiting ICP</p>
