EVALUATION of OUTCOMES – to be completed AFTER scenario.

1. Which findings have you collected that are most important and need to be noticed as clinically significant?

Most Important Maternal Assessment Findings	Clinical Significance
hypertension/PAIN	pain/contractions causing HTN, tachysystole due to oxy.
Most Important Fetal Assessment Findings	Clinical Significance
Late Deceleration	fetal distress, IUR

2. After implementing the plan of care, interpret clinical data at the end of your shift to determine if your patient's condition has improved, has not changed, or has declined.

Most Important Data	Patient Condition		
	Improved	No Change	Declined
Pain	✓	—	
HTN	✓		
Fetal decel	✓		

3. Has the patient's overall status improved, declined, or remained unchanged during your shift? If the patient has not improved, what other interventions must be considered by the nurse?

Overall Status	Additional Interventions to Implement	Expected Outcome
Improved	assess fundus → pain manage →	firm keep mom comfortable

End of shift SBAR to oncoming nurse (the observers for your scenario)

Situation	AJ 24yo F, 39wks, gave birth to baby vaginally, Had late decels during labor so we did IUR, (GBS+) did receive ^{anx.} Did not follow birth plan or documentation about pain <i>Lochia moderate Fundus firm</i>
Background	G2 P2, hx of asthma, anaphalactic response to penicillin, GBS+, denies complication w/ other pregnancy
Assessment	Fundus Emotions Baby bonding Lochia
Recommendation	Assess fundus and pain Make sure to manage family member Limit stress Manage pain
