

Pediatric ED Reflection Questions:

1. I was able to observe several different diagnoses.
A child was diagnosed with appendicitis.
A child was diagnosed with liver failure.
A child was diagnosed with strep.
2. Many patients seen in the ED were in the school age group. It was not what I was expecting, I was expecting to see more of the toddler or preschool age. Mainly because they are more prone to accidents.
3. I was unsure what to expect going to the ED. This module has been an emotional experience for me, so I am grateful that I did not have to observe any major trauma regarding a child.
4. For question 7, suicidal ideation has been a mental health trend in the pediatric population, especially transgender children.
5. For question 12, Child Life eases the care for the children and the parents by using a variety of tactics to help them understand the process.
