SLO's In OB SIM

Professionalism: During OB SIM I showed up on time in the right uniform with all the correct paperwork done. I also came ready to learn and participate in each sim. I was ready to input my thoughts and opinions into each sim and ready to learn from my mistakes and others. I took constructive criticism and learned from it for each simulation.

Patient Centered Care: During OB sim each sim was specific to a patient and included different problems. Along with worrying about the patient I also worried about the family members in the room. During my time as nurse, I tried to help with emotions and worries about discharge. Along with this, it was good education and walking the patient through what we were doing and why we were doing something. So, the patient would be at somewhat at ease.

Clinical Judgment: During my simulation, me and my team at clinical judgement stopped oxytocin and did the four turns when the patient went into Tachysystole. When I called the doctor, the doctor was in a rush and gave me an order to increase the oxytocin. I went to my charge nurse to handle the order while I stayed with the patient. I used my clinical judgment not to follow the order because it would be damaging to the patient and her baby.
