

Life Before Birth

Kindal King

September, 2 2025

This video gives an extensive look into what happens from conception to birth with the use of 4D ultrasound. It all starts with millions of tiny sperm racing to the egg. Once the sperm successfully reaches the inside of the egg, all the genetic material equally mixes to decide everything about the baby and divides, divides, and divides some more! All of the vital organs and body parts form in the first weeks of life. At 8 weeks, the embryo is technically called a fetus and the placenta is now mature. The mother's blood supplies everything the baby needs to survive. Weeks may not seem like much to us, but to a baby every week in development is crucial life-changing (literally).
