

<p>Step 1 Description</p> <p>For this CPE, which took place at the SIM lab where I had the scenario of taking care of a patient that was admitted with urosepsis and had some past medical history. Patient was receiving IV fluids and had a few other medications that needed to be administered as well.</p>	<p>Step 4 Analysis</p> <p>I was able to apply what we have learned in previous modules and previous CPE's to this event and that was helpful. I think most people had the same response the CPE and thought we were well prepared and set up for this CPE scenario.</p>
<p>Step 2 Feelings</p> <p>In the beginning of CPE I was feeling extremely nervous but as I got started and was talking to my patient I started to feel a little more confident and felt like I knew what I was doing which was a good feeling. I ended up passing which made me very happy and was a huge relief.</p>	<p>Step 5 Conclusion</p> <p>I don't know if there was anything I could've done to make this situation better. I feel like I did okay and maybe next time I just need to do extra teachings.</p>
<p>Step 3 Evaluation</p> <p>I think the event was a lot easier than I was anticipating which was a huge relief. I feel like I was overcomplicating the whole CPE situation but it ended up being okay, I think the paperwork and rubric we were provided with was a great help and set me up for success.</p>	<p>Step 6 Action Plan</p> <p>Overall this was a good CPE experience. I think this CPE has helped me become more confident and I hope I can carry that into future CPE's.</p>
