

## Yes! Assessment Recommendation for Erin Pulvenis

Erin Pulvenis aged 15 and in grade 9 completed the YES assessment. Erin did so in order to help her gain clarity about subject selections and enable her to make confident and definite decisions with regard to the future.

Erin is a good student gaining good grades in all her subjects she currently takes at school.

From the assessment we were able to confirm that her personality is one that has wonderful balance. She is a natural calming element in situations she finds herself in, having the blessed combination of understanding both sides of the coin.

Erin is well liked and friends confirm that she is kind, encouraging and positive.

Erin has a selection of interests that show her clearly having the ability to be well placed in positions where she is involved with people. She thinks creatively and practically in ways that create solutions in many aspects and has a strong influential ability among her peers.

Erin's skills and abilities also show strong trends in supporting her personality and interests and are undergirded by strong priorities.

Erin had thought of doing Psychology but with further examination we agreed that she could be well placed in a several different contexts, where she can use her balanced personality, interests and skills to support others.

We looked at several areas of possibilities in the 'Personal Care fields' such as Occupational Therapy, Nutritionist (as she has a natural interest in food), Dietician, Podiatrist, Dermatology as well as a physiotherapist.

She is battling to make sense of what is her 'one thing' and this will change the groupings slightly for her subject choices.

Erin has been tasked with further investigation into these suggested areas both through information online and face to face discussion with those in the relative fields. We all agreed that she needs to have a strong foundational subject selection that will lend itself to multiple career choice possibilities.

Her subject selection would include physical science and life science if she went into a medical field or Health science and life science.
