

Why Edvance360?

Responsive, Custom Interface.

The interface received a lot of our attention when preparing Version 8 for our clients, including being designed as "Mobile First" which means that regardless of the device that you and your users access the application on you will have the same look and feel. The design is responsive so that it will perform well on phones, tablets, and of course computers still! Another cool addition is notifications in the upper right corner and accordion menus.

Easy to Use Course Wizard

Administrators and Instructors can now quickly build a course directly from the home page using our easy and intuitive wizard. You can specify whether or not to have lessons, tests, and other content; for the content sections chosen you can add documents, videos, and more directly from the wizard.

Easy to Grade. In-Browser Document Reading and Markup

Instructors no longer have to download dropbox submissions to view students' work. Now simply clicking on the file name allows the user to view the document inline in the browser.

Dashboard. Reports are Passe.

We've added so many new widgets with this release that we had to add a whole new page called "Dashboard" to stop the home page from scrolling so far down! Some of the new features include

- My Courses with Progress Bar
- Certificates Earned
- Logins over past two weeks
- Course Progress Gauges
- ... and much more!

Why Edvance360?

Granular Controls. You Control Access.

An administrator can now give users very specific permissions to nearly every section of the application. You are now in control over which sections and tasks can be used by learners or instructors. You can even create a new user level and assign the permissions that you choose.

Offline Reporting. Access Anytime, Anywhere.

You can now access more reports directly from the home page, and track your users' offline activities also. This includes the ability to import from and export to Excel spreadsheets.

Wiki 2.0. More Options, More Power, More Robust.

We completely redesigned Wikis for Version 8 including the ability to track changes made by users and when they were made, start and carry on a discussion about the content so that it doesn't have to happen within the project and you can also print the Wiki if you choose.

Revamped Calendar. Scheduling at a Whole New Level.

With this release we have added a better display of multiple events per day, allow adding calendar events from more screens, and added the ability for the user to color code events.
