Refer to the above article and fill in the blanks for the following questions. Submit to the Sleep Apnea Dropbox by 0800, March 2nd. If you are unable to ctrl/click to open the article, copy and paste the link in the address box.

1) What is obstructive sleep apnea (OSA) characterized by?

Obstructive sleep apnea (OSA) is characterized by the collapse of upper airways during sleep with ineffective respiratory efforts, intermittent hypoxia, and sleep disruption.

2) How does the distribution of comorbidities differ between men and women?

The distribution of comorbidities differ between men and women because men are at a higher prevalence for diabetes and ischemic heart disease with a diagnoses of OSA and women are at a higher prevalence for hypertension and depression with a diagnosis of OSA in comparison to the population not affected by OSA.

3) Name 10 common comorbidities often present in OSA patients.

- a. . systemic hypertension
- b. . asthma
- c. . ischemic stroke
- d. . COPD
- e. . diabetes mellitus
- f. . gastroesophageal reflux
- g. . anxiety
- h. . depression
- i. . coronary artery disease
- j. . dyslipidemia

4) The best studied cardiovascular comorbidity in OSA is systemic hypertension.

5) **What arrhythmia is especially prevalent in OSA patients?**

Atrial fibrillation (AF) is especially prevalent in OSA patients.

6) **Highly prevalent in OSA patients, the metabolic syndrome is a pre-diabetic state associated with central obesity and increased cardiovascular risk.**

7) **Untreated OSA in diabetic patients is associated with increased prevalence of neuropathy, peripheral arterial disease, diabetic retinopathy, and diabetic nephropathy.**

8) **The association between OSA and chronic obstructive pulmonary disease is known as what?**

The association between OSA and COPD is known as “overlap syndrome”.

9) **Sleep studies confirmed that OSA is more common in asthmatics than in controls, and the combination of OSA and asthma had a higher frequency of asthma exacerbations.**

10) **Careful assessment of comorbidities should become standard clinical practice for OSA patients.**
