

1. While listening to this video, I felt very uncomfortable and worrisome. I was able to complete the word search but was slow to do so because of the voices in my head from the video. I was very distracted as I was searching for the words. After listening, I can see how going through your day-to-day life with these auditory hallucinations can distract someone from completing tasks, even simple ones. Looking back at the Clinicas on 1 South, many patients had problems with hallucinations, and it makes one wonder if they are always hearing these “voices” and if they are able to drown out the noise after a while.
2. I heard the voices calling the person stupid and worthless. As well as what sounded like suicidal ideations telling them to jump in front of a car, then acting Bipolar by then saying don't do it. Lots of mixed emotions coming from the voices. The majority It then went into a tangent about coffee futures and how they need their investment to be 23% gain in order to have professional functions. The phrasing doesn't make much sense when listening to it and it throws your brain off as it's designed to do. There were multiple voices talking over each other about different topics ranging from coffee to suicide, etc. The video was loud and quiet. Some voices whispering and others talking loudly. I would say it was louder based on the fact of how confusing it was to listen to. The most prevalent voice was the one that constantly was taking deep breaths or smacking his lips. The volume was too loud in my ear from trying to hear everything and disturbed me the most when I first heard him do that.
3. I was unfortunately able to listen to the whole video while completing the word search. In the beginning, I had thoughts of turning it off but decided to bear through it till the end. During the video about halfway through was when it got tough and started to make me have anxiety because of how much was going on in my ears. My brain couldn't handle the mixed emotions and disorienting sounds.
4. In the future when caring for Schizophrenic patients it will change my care because now I know about what's happening in their brain. Before the video, I thought Schizophrenic patients only had visual hallucinations instead of auditory, but it makes sense now. I don't know it was a positive thing learning about how they think because the next time I have a schizophrenic patient, the only thing I'll be able to think of when talking to them is this video. I'm sure those thoughts will go away after a while though. If I had known about this video before completing my 1 South clinical, I would have asked more questions toward my patient about their hallucinations. It is an interesting topic and each patient has their own hallucinations. I now want to know what exactly they are thinking and how strongly they have these auditory and visual hallucinations.
