

Sleep Apnea Assignment

(Online Content 1H)

Unit Objectives:

- Understand the relationship(s) between obstructive sleep apnea and cardiovascular risk. (1,2,6,7)*

In order to receive full credit (1H class time) for this assignment, it must be completed in its entirety by 2/27/2025 at 0800. Any assignment not completed in its entirety will result in missed class time.

Refer to the above article and fill in the blanks for the following questions. Submit to the Sleep Apnea Dropbox by 0800, 2/27/2025. If you are unable to ctrl/click to open the article, copy and paste the link in the address box.

- 1) What is obstructive sleep apnea (OSA) characterized by?
Episodes of a complete airway collapse or a partial collapse with an associated decrease in oxygen saturation or arousal from sleep.
- 2) How does the distribution of comorbidities differ between men and women?
The distribution of comorbidities differed between men and women, with DM and ischemic heart disease being more prevalent in men with OSA, and HTN and depression being more prevalent in women with OSA compared to non-OSA subjects.
- 3) Name 10 common comorbidities often present in OSA patients.
 - a. Cardiovascular & cerebrovascular diseases
 - b. Systemic HTN
 - c. Cardiovascular events &/or death
 - d. Arrhythmias
 - e. Cerebrovascular disease
 - f. Metabolic diseases

- g. OSA and metabolic syndrome
 - h. OSA & DM
 - i. Renal disease
 - j. COPD
- 4) The best studied cardiovascular comorbidity in OSA is Systemic HTN
 - 5) What arrhythmia is especially prevalent in OSA patients? A Fib
 - 6) Highly prevalent in OSA patients, the metabolic syndrome is a pre-diabetic state associated with central obesity & increased cardiovascular risk.
 - 7) Untreated OSA in diabetic patients is associated with increased prevalence of neuropathy, PAD, diabetic retinopathy and diabetic nephropathy.
 - 8) The association between OSA and chronic obstructive pulmonary disease is known as what? Overlap Syndrome
 - 9) Sleep studies confirmed that OSA is More common in asthmatics than in controls, and the combination of OSA and asthma had a higher frequency of asthma exacerbations.
 - 10) Careful assessment of comorbidities should become standard clinical practice for OSA patients.
