**Medical History (5 Points)**

**Past Medical History:** Myocardial Infarction (2017) Diabetes mellitus, Hypertension, Hypothyroidism, Chronic obstructive pulmonary disease, morbid obesity

**Past Surgical History:** Coronary artery bypass graft (2017), C-section (1992)

**Family History:** Mother: heart failure Father: diabetes mellitus

**Social History (tobacco/alcohol/drugs):** Smoked for 20 years, 2 packs a day. States no use of alcohol or illicit drugs

**Admission Assessment**

**Chief Complaint (2 points):** Pain management (from left hip surgery)

**History of present Illness (10 points):** Onset: Pain in left hip that feels as if there is “bone on bone grinding.” Location: Left hip. Duration: Pain existed for 10 years, complained to many providers but never received any further diagnostic or treatment until getting referred from a nurse practitioner this year. Characteristics: grinding pain. Aggravating: movement causes more pain, but pain is constant. Relieving: nothing seems to relieve the pain. Treatment: prior to surgery pt used prescribed and over the counter pain medications.

**Primary Diagnosis**

**Primary Diagnosis on Admission (3 points):** Pain management from left hip surgery.

**Secondary Diagnosis (if applicable):** Impaired mobility due to recovery from surgery

**Pathophysiology of the Disease, APA format (20 points):**

Patient is recovering from hip surgery performed on 10/19/2020. Patient states that she had been experiencing pain with movement in her left hip for the past 10 years. She had gone to multiple providers for the pain but never received further diagnosing or adequate pain relief from them. Until summer 2020 when a Nurse practitioner referred her to radiology. The left hip X-ray revealed narrowing in joint space, as well as the formation of osteocysts in that region. "Osteophytes are small bony projections that can impinge on nerves and obstruct blood supply to the joint's components" that are often found at the sites of cartilage loss (Capriotti, 2020). The breakdown of the cartilage in this region can be attributed to the constant stress put on by the patient's weight, the patient is in the morbidly obese BMI range. The patient's weight is probably attributed from lifestyle choices such as poor diet and sedentary lifestyle and smoking. To reduce likelihood of clot formation after hip replacement patients are encouraged to wear compression stockings, to keep blood from pooling in lower extremities, and are often put on blood thinners temporarily. Patients can expect slow recovery and lots of physical therapy, not obtaining full strength recovery until up to 12 months after surgery. ("Hip replacement," 2020)

**Diagnostic Imaging**

**All Other Diagnostic Tests (10 points):** Diagnostic Left hip X-ray obtained 07/13/2020 after referral to radiology after years of pain. X-ray finds Adv degeneration of joint space, large osteophytes. Basically, her cartilage in that hip had broken down to the point that she had bone on bone friction which sounds very painful.

**Concept Map (20 Points)**

### Subjective Data

Pt states that she delt with a grinding “bone on bone” pain for over 10 years

### Nursing Diagnosis/Outcomes

- 1. Impaired physical mobility
  - a. Goal met, pt shows proper ambulation with assistive walking device
  - b. Pt acknowledges education on recovery and the effects of her weight on her body/joints
- 2. Risk for instability of blood glucose
  - a. Pt knowledge on checking blood sugars is refreshed and she acknowledges the importance of doing it.
  - b. Pt pledges to follow up with regular provider to get blood glucose back under control

### Objective Data

Patient is recovering from left hip surgery, weak movement in left leg. Pt also appears to have high blood glucose labs

Vital Signs:  
HR:70  
BP:161/76  
Respirations: 20  
Temperature:35.9 C (96.8 F)  
Pulse Oximetry: 94%

### Patient Information

Left hip X-Ray shows degeneration of cartilage

### Nursing Interventions

Demonstrate to pt proper usage of assistive device  
Pt education on resting, reducing stress on joints (diet) and handling pain without pharmaceuticals  
Check pts knowledge on managing blood glucose  
Encourage pt to follow up with regular provider to get glucose back to normal.
