

N321 Care Plan # 2

Lakeview College of Nursing

Name: Destiny Bell

Demographics (3 points)

Date of Admission 10-09-2021	Patient Initials R.S	Age 47 Years old	Gender Male
Race/Ethnicity Caucasian	Occupation N/A	Marital Status Separated	Allergies N/A
Code Status Full code	Height 5'8 feet	Weight 186 lbs 9.6 oz	

Medical History (5 Points)

UNABLE TO ATTAIN SOME DUE TO AIRWAY COMPROMISE, NG TUBE PLACED

ANSWERS BY NODDING OR THUMBS UP

Past Medical History: N/A

Past Surgical History: N/A

Family History: N/A

Social History (tobacco/alcohol/drugs):

- Drinks daily, history of alcohol abuse
- Smokes tobacco (Cigarettes) a few a day
- No recreational drug use reported

Assistive Devices: N/A

Living Situation: Lives alone

Education Level: Highschool diploma

Admission Assessment

Chief Complaint (2 points): Throat Swelling

History of present Illness (10 points): Patient presented to the emergency room on October 9th after calling 911, with a chief complaint of throat swelling. Patient stated that he woke up in the morning and that he felt like his throat was closing so he called 911.

Primary Diagnosis

Primary Diagnosis on Admission (2 points): Epiglottitis

Secondary Diagnosis (if applicable):

Pathophysiology of the Disease, APA format (20 points):

Epiglottitis is the infection and inflammation of the epiglottis also known as the flap of tissue that sits atop the trachea to keep food from going into the trachea during swallowing (Capriotti, 2020). It may be caused by a respiratory infection, exposure to chemical substances in the environment, trauma, and various organisms, including bacteria, viruses, and fungi (Capriotti, 2020). Common organisms that cause epiglottitis include *Streptococcus pneumoniae*, *Haemophilus influenzae*, parainfluenza, varicella-zoster virus, herpes simplex virus type 1, and *Staphylococcus aureus* (Capriotti, 2020). Blood tests for epiglottitis will show signs of infection or inflammation, which we can see based off the patient's labs listed below, and ABGs will confirm lack of gas exchange (Capriotti, 2020). *H. influenzae*, and other infections of the epiglottis can lead to edema and swelling of the epiglottis of patients of any age and can rapidly spread to adjacent structures leading to a airway obstruction (Guerra, 2021) . While *H. influenzae* remains the most common pathogen in both adults and children, other organisms such as *S. Pneumoniae*, *S. aureus*, and beta-hemolytic *Streptococcus sp.* are important pathogens also

in both adults and children (Guerra, 2021). In immunocompromised patients, the list of potential causes is much longer and must include *Mycobacterium tuberculosis*, as well as a litany of others, though the relative frequencies remain the same (Guerra, 2021). Symptoms may be mild for hours or days until they dramatically worsen and will result in the patient appearing very uncomfortable and possibly toxic (Guerra, 2021). Adults may be reluctant to lie flat or be uncomfortable when doing so and drooling, dysphagia, and distress, or anxiety may be present, which we seen in our patient as he was drooling and appeared restless (Guerra, 2021). Swelling of the upper airway results in turbulent airflow during inspiration or stridor, which we observed in the patient and he had a stridor (Guerra, 2021). Signs of severe upper airway obstruction such as intercostal or suprasternal retractions, tachypnea, and cyanosis are concerning for impending respiratory failure and should signal the provider to act quickly (Guerra, 2021). The most important aspect of treatment is to secure the patient's airway, which likely results in the patient being intubated or a tracheostomy performed, which we observed in our patient as he had a trach placed and a NG tube (Guerra, 2021). Some common complications of epiglottitis are hypoxia, respiratory failure, septic shock, prolonged ventilation, and even death (Guerra, 2021). For most patients the prognosis is good when the diagnosis and treatment of the disorder are prompt (Guerra, 2021).

Hospital Medications (5 required)

Brand/ Generic	Clonazepam (Klonopin)	Ferrous sulfate (Folic Acid)	Hydrochlorothiazide	Miralax (Polyethylene glycol (PEG) syrup)	Thiamine (Vit b-1)
Dose	0.5mg	1 mg	12.5 mg	5ml	100mg
Frequency	Every 12 hours	Daily	Daily	Twice a day	Daily
Route	Oral	Tube- Gastric	Oral	Oral	Oral
Classification	Pharmacologic class: Benzodiazepine Therapeutic class: Anticonvulsant, antipanic Pregnancy: NA Controlled substance schedule: IV	Pharmacologic class: Hematinic Therapeutic class: antianemic, nutritional supplement Pregnancy: NA	Pharmacologic class: thiazide diuretic Therapeutic class: diuretic Pregnancy: B	osmotic laxatives.	Calcium supplement Pregnancy: A
Mechanism of Action	Although unknown, the drug is thought to prevent panic and seizures by potentiating the effects of gamma- aminobutyric acid (GABA), which is an inhibitory neurotransmitter. This action is also	Acts to normalize RBC production by binding with hemoglobin or by being oxidized and stored as hemosiderin or aggregated ferritin in reticuloendothelial cells of the bone	A thiazide diuretic, hydrochlorothiazide promotes movement of sodium chloride in water from blood in peritubular capillaries into nephrons distal covulated tubule. Initially, it may decreased cardiac	PEGs have a variety of molecular weights and are composed of multiple ethylene glycol monomer units that	Thiamine combines with adenosine triphosphate (ATP) in the liver, kidneys, and leukocytes to produce thiamine diphosphate.

<p>though to suppress the spread of seizure activity caused by seizure-producing foci in the cortex, limbic, and thalamus structures.</p>	<p>marrow, liver, and spleen. Iron is an essential component of hemoglobin, myoglobin, and several enzymes, including catalase, cytochromes, and peroxidase. Iron is needed for catecholamine metabolism in normal neutrophil function</p>	<p>output, extracellular fluid volume, or plasma volume, which helps explain Blood pressure reduction. It may also reduce blood pressure by direct arteriolar dilation. After several weeks, cardiac output, extracellular fluid volume, and plasma volume return to normal, and peripheral vascular resistance remains decreased.</p>	<p>undergo catalysis.^[1] As a medication, PEG is soluble in water and is not reabsorbed in the gastrointestinal tract. PEG forms hydrogen bonds with water molecules. For this reason, it can prevent the reabsorption of water, which causes water retention in the stool and increases the osmotic pressure. As a result, the stool softens, and bowel movements occur more frequently</p>	<p>Thiamine diphosphate acts as a coenzyme in carbohydrate metabolism, in transketolation reactions, and in the utilization of hexose in the hexose-monophosphate shunt. Without adequate thiamine, pyruvic acid does not undergo conversion to acetyl-CoA and cannot enter the Krebs cycle. Pyruvic acid accumulates in the blood and is subsequently converted to lactic acid, with the potential development of lactic acidosis. Diminished production of NADH in the Krebs cycle also results in lactic acid production through</p>
---	--	--	---	---

				<p>facilitation of anaerobic glycolysis. Thiamine deficiency appears as a nonspecific syndrome: headache, nausea, malaise, myalgias. Severe thiamine deficiency causes beriberi. Beriberi can affect the cardiovascular system (wet beriberi) and the nervous system (dry beriberi and the Wernicke-Korsakoff syndrome). Cardiovascular manifestations include peripheral vasodilation, biventricular failure, and edema. Neurologic symptoms include neuropathy, ataxia, retrograde</p>
--	--	--	--	---

					<p>amnesia, impaired ability to learn, and confabulation. Once Korsakoff's syndrome appears, thiamine supplementation is successful in only half of the patients.</p>
Reason Client Taking	To reduce anxiety/panic	Possible anemia PREVENT iron deficiency	To manage blood pressure	constipation	To increase calcium
Contraindications (2)	Acute- narrow-angle glaucoma; Hepatic disease; hypersensitivity to clonazepam, other benzodiazepines, or their components	Hemochromatosis, hemolytic anemia's, hemosiderosis, hypersensitivity to iron salts or their components, other anemic conditions unless accompanied by iron deficiency	Anuria; hypersensitivity to hydrochlorothiazide, other thiazides, sulfonamide derivatives, or their components	<p>contraindicated in patients with known or suspected bowel obstruction, appendicitis, inflamed bowel disease, perforated bowel, and hypersensitivity to polyethylene glycol any component of the formulation.</p> <p>Precautionary measures are necessary for patients</p>	<p>Encephalopathy Wernicke's encephalopathy may be precipitated or worsened if intravenous glucose is administered to a thiamine-deficient patient. Thiamine (vitamin B1) should be administered prior to glucose. Clinicians should note that parenteral glucose should never be</p>

with electrolyte imbalances and patients with renal impairment

administered to a comatose patient without the prior administration of thiamine. Pregnancy Thiamine is classified as FDA pregnancy risk category A. Appropriate maternal thiamine (vitamin B1) intake is encouraged during pregnancy, and no maternal or fetal complications associated with maternal dietary intake or supplementation to achieve adequate intake goals have been reported. As with other water-soluble vitamins, the pregnancy risk factor increases to FDA risk category C if the vitamin is

				<p>used in dosages exceeding the Recommended Dietary Allowance (RDA) during pregnancy. Breast-feeding According to the manufacturer, caution should be exercised when thiamine is administered during breast-feeding. However, while thiamine is excreted in human milk, appropriate maternal intake of thiamine (vitamin B1) is important during lactation, and no maternal or fetal complications have been identified with maternal supplementation to achieve adequate intake goals during breast-feeding. Seizures have occurred in</p>
--	--	--	--	---

				<p>nursing infants of mothers with thiamine deficiency, although causality has not been established. Supplementati on with thiamine is recommended in lactating women whose diets do not provide adequate amounts of thiamine. The American Academy of Pediatrics classifies thiamine as compatible with breast-feeding. Consider the benefits of breast-feeding, the risk of potential infant drug exposure, and the risk of an untreated or inadequately treated condition. If a breast-feeding infant experiences an adverse effect</p>
--	--	--	--	---

					related to a maternally administered drug, healthcare providers are encouraged to report the adverse effect to the FDA.
Side Effects/Adverse Reactions (2)	<p>CNS: Abnormal dreams, aggression, agitation, amnesia, anxiety, Patti, ataxia, attention disturbance, confusion, depersonalization, depression, dizziness, drowsiness, emotional liability, excessive dreaming, fatigue, hallucinations, headache, hostility, hysteria, insomnia, irritability, memory loss, nervousness, nightmares, organic disinhibition, psychosis, reduced intellectual ability, sleep disturbances, suicidal ideation</p> <p>CV: palpitations</p> <p>EENT: blurred vision, spasms, increase salivation, loss of taste, pharyngitis, rhinitis, sinusitis, yawning</p> <p>GI: abdominal pain, anorexia, constipation,</p>	<p>CNS: dizziness, fever, headache, paresthesia, syncope</p> <p>CV: chest pain, hypertension, hypotension, tachycardia</p> <p>EENT: metallic taste, tooth discoloration</p> <p>GI: abdominal cramps, constipation, epigastric pain, nausea, stool discoloration, vomiting</p> <p>HEME: Hemachromatosis, hemolysis, Hemosiderosis</p> <p>RESP: dyspnea, wheezing</p> <p>SKIN: Diaphoresis, flushing, pure writers, rash, urticaria</p> <p>Other: anaphylaxis (with IV administration), angioedema, injection site discoloration</p>	<p>CNS: Asthenia, dizziness, fever, headache, insomnia, paresthesia, restlessness, vertigo, weakness</p> <p>CV: elevated cholesterol and triglyceride levels, hypotension, orthostatic hypotension, vasculitis</p> <p>EENT: acute myopia, acute angle-closure glaucoma, blurred vision, dry mouth</p> <p>ENDO: hyperglycemia</p> <p>GI: A domino cramps, anorexia, constipation, diarrhea, indigestion, notice, nausea, pancreatitis, vomiting</p> <p>GU: decreased libido, impotence, interstitial nephritis, Nocturia, polyuria, renal failure</p> <p>HEME: Agranulocytosis,</p>	<p>flatulence, nausea, stomach cramps, diarrhea, swollen abdomen, and rectal hemorrhage</p>	<p>Severe angioedema / Rapid / Incidence not known</p> <p>anaphylactoid reactions / Rapid / Incidence not known</p> <p>pulmonary edema / Early / Incidence not known</p> <p>GI bleeding / Delayed / Incidence not known</p> <p>cyanosis / Early / Incidence not known</p> <p>Mild pruritus / Rapid / 1.0-1.0 restlessness / Early / Incidence not known</p> <p>diaphoresis / Early / Incidence not</p>

	<p>increased appetite GU: altered libido, difficult ejaculation, dysmenorrhea, dysuria, enuresis, impotence, Nocturia, urine retention, UTI HEME: anemia, eosinophilia, leukopenia, thrombocytopenia MS: dysarthria, myalgia RESP: bronchitis, cough, respiratory depression Other: allergic reaction</p>		<p>aplastic anemia, bone marrow failure, hemolytic anemia, leukopenia, neutropenia, thrombocytopenia MS: muscle spasms and weakness RESP: pneumonitis, pulmonary edema SKIN: alopecia, cutaneous vasculitis, erythema multiforme, exfoliative dermatitis, photosensitivity, putouts, rash, Steven-Johnson's syndrome, toxic epidermal necrolysis, urticaria Other: Anaphylaxis, dehydration, Hypercalcemia, hyperuricemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypobulimia, metabolic alkalosis, weight loss</p>		<p>known sneezing / Early / Incidence not known urticaria / Rapid / Incidence not known nausea / Early / Incidence not known weakness / Early / Incidence not known injection site reaction / Rapid / Incidence not known</p>
<p>Nursing Considerations (2)</p>	<p>• use clonazepam cautiously and patience with mixed seizure disorder (because drug can increase the risk of generalized tonic clonic seizures), renal failure, or troublesome</p>	<p>• give iron tablets and capsules with a full glass of water or juice. Do not crush enteric coated tablets are open capsules • dilute and administer with a straw or place</p>	<p>- give hydrochlorothiazide in the morning and early evening to avoid nocturia - Monitor blood pressure, daily weight, fluid intake and output, and serum levels of</p>	<p>NA</p>	<p>Hepatic Impairment It appears that no dosage adjustments are needed. Renal Impairment It appears that no dosage</p>

secretions (because clonazepam increases salivation) and in elderly patients (because there are more sensitive to drug's CNS effects). Also use cautiously and patients with compromised respiratory function and porphyria.

- Monitor Blood drug level, CBC, and liver enzymes during long-term or high-dose therapy as ordered
- Monitor patient closely for signs of loss of effectiveness of anti-convulsant activity, especially within the first three months of administration. Notify prescriber if noted, because it dosage adjustment may reestablish effectiveness.

WARNING: know that the drug should not be stopped abruptly. Instead, expect to taper dosage gradually by 0.125 mg twice daily every three days, until the drug is completely discontinued, to void withdrawal symptoms and seizures.

- Monitor patient closely for evidence

drops in the back of patients throat, because iron solutions may stay in teeth. Mix that elixir form in water. Fer-in-sol drops or syrup maybe be extra juice or water.

- know that to maximize absorption, iron salt should we give him one hour before or two hours after meals. If G.I. irritation occurs, give with or just after meals
- protect the liquid form from freezing.
- administer injectafer intravenously, either as an undiluted so IV push or by infusion. When administering a slow IV push give out the rate of about 100 mg or two ML's per minute. When administering via infusion, dilute up to 750 mg of iron in no more than 250 ML of sterile 0.9% sodium chloride injection, US P, such that the concentration of the infusion is not less than 2 mg of

electrolytes, especially potassium

- assess for evidence of hypokalemia such as muscle spasms and weakness
- check blood glucose level often, as ordered, and diabetic patients, and expect to increase anti-diabetic dosage, as needed and prescribed
- know that if patient has Gouty arthritis, expect increased risk of gout attacks during therapy
- Monitor bun in serum creatinine levels, as ordered, especially in patients with chronic kidney disease, Renal artery stenosis, severe congestive heart failure, or volume depletion, because of increased risk of acute renal failure with hydrochlorothiazide therapy. Notify prescriber if serum creatinine levels become elevated, as drug may need to be withheld or discontinued.
- Monitor patient for decreased visual acuity or ocular pain, especially within hours two weeks of beginning drug

adjustments are needed.

Intermittent hemodialysis
Patients on dialysis may have increased needs for thiamine.

Peritoneal dialysis
Patients on dialysis may have increased needs for thiamine

of suicidal thinking or behavior, especially when therapy starts or dosage changes

- be aware that paradoxical and psychiatric reactions have occurred with benzodiazepines. Because clonazepam is a benzodiazepine, monitor patient for aggression, agitation, anger, anxiety, hallucinations, irritability, nightmares, and psychoses. Children and elderly patients are at a greater risk of developing paradoxical reactions. If noted, notify prescriber and expect drug to be discontinued gradually.

WARNING: be aware that benzodiazepine therapy like clonazepam should only be used concomitantly with opioids and patience for whom other treatment options are inadequate. If prescribed together, expect dosing and duration of the opioid to be limited. Monitor patient closely for signs and symptoms of

iron per ML, and administer over at least 15 minutes. Once diluted, solution is stable for 72 hours at room temperature.

- avoid extravasation with IV administration because brown discoloration of the extravasation site may be long lasting.

WARNING: Monitor patients closely for hypersensitivity reactions for at least 30 minutes after IV administration. If present, discontinue drug immediately, notify prescriber, and be prepared to provide supportive care, as needed.

- Monitor patient's blood pressure after each IV dose for significant increases, as hypertension may occur immediately after administration but usually resolves within 30 minutes.
- be aware that at usual dosages, serum hemoglobin level and usually normalizes in about

therapy and in patients with a history of penicillin or sulfonamide allergy, as acute myopia and acute angle closure glaucoma may develop. If left untreated, permanent blindness may occur if present, notify prescriber immediately, expect to discontinue hydrochlorothiazide, and assist with prompt medical or surgical intervention, as indicated.

WARNING: be aware that even minor alterations and fluid and electrolyte balance may precipitate hepatic coma in patients with impaired hepatic function

decreasing consciousness, including coma, profound sedation, and significant respiratory depression. Notify prescriber immediately and provide emergency supportive care, as death may occur.

- know that although the risk of teratogenicity is inconclusive, administration of benzodiazepines like clonazepam immediately before or during childbirth can cause a syndrome of difficulty feeding, hypothermia, hypotonia, and respiratory depression in the infant after birth. Also know that if mothers have taken clonazepam during the later stages of pregnancy, their infants may develop a dependency on the drug and experience withdrawal after birth.**

two months and less blood loss continues.

Treatment may last for 3 to 6 months to help replenish iron stores.

WARNING: Monitor patient for signs of iron overdose, which may include abdominal pain, diarrhea, nausea, severe vomiting, and sharp abdominal cramps.

In case of iron toxicity or accidental iron overdose, give deferoxamine, as prescribed. As few as three at all iron tablets can cause serious poisoning in young children.

- don't give antacids, Coffee, dairy products, eggs, tea, or whole-grain bread or cereals within one hour before or two hours after iron.**
- remember that unabsorbed iron turns stool black or green and can mask blood in stool. Check stool for occult blood as ordered**

Nursing Care

Summary of Care (2 points)

Overview of care: Patient was admitted for epiglottitis and a tracheostomy was done and placed due to airway obstruction and patient has been placed on optiflow 30L/min and a NG tube has been inserted for feedings.

Procedures/testing done: glucose and labs

Complaints/Issues: No complaints/issues were verbalized

Vital signs (stable/unstable): Stable

Tolerating diet, activity, etc.: tolerating diet and activity

Physician notifications: none during this shift

Future plans for patient: Patient will be meeting with therapy

Discharge Planning (2 points)

Discharge location: possibly home

Home health needs (if applicable): na

Equipment needs (if applicable): na

Follow up plan: follow up with primary care physician upon discharge

Education needs: education of tube feedings and trach care, cessation of smoking and alcohol use

Nursing Diagnosis (15 points)

Must be NANDA approved nursing diagnosis and listed in order of priority

<p>Nursing Diagnosis</p> <ul style="list-style-type: none"> • Include full nursing diagnosis with “related to” and “as evidenced by” components 	<p>Rational</p> <ul style="list-style-type: none"> • Explain why the nursing diagnosis was chosen 	<p>Intervention (2 per dx)</p>	<p>Evaluation</p> <ul style="list-style-type: none"> • How did the patient/family respond to the nurse’s actions? • Client response, status of goals and outcomes, modifications to plan.
<p>1. Ineffective gas exchange related to the patient’s obstructed airway resulting from his epiglottis as seen in the patient’s labs and ABG’s</p>	<p>The ABG drawn for this patient indicates respiratory acidosis and is the main reason the patient was admitted.</p>	<p>1.Maintain oxygen administration through optiflow and keep oxygen saturation above 90% 2.Position the patient in a semi-fowlers position to promote ventilation</p>	<p>The patient’s oxygen level is being maintained above 90% with the use of optiflow assistance and patient remained in semi-fowler’s position throughout the shift</p>
<p>2. Anxiety related to treatment with</p>	<p>Patient was restless in his room and unable to relax</p>	<p>1. Medications to decrease anxiety/panic such as the clonazepam</p>	<p>The clonazepam seems to be successful in helping treat the patient’s</p>

<p>Optiflow and placement of NG tube and Tracheostomy</p>	<p>due to secretions in his trach and appeared kind of annoyed while receiving feedings through NG</p>	<p>the patient is taking 2.promote a calm environment by eliminating extra staff, decreasing sound and stimulation, and reducing lights in room</p>	<p>anxiety/panic. By eliminating extra stressors in the room it helped to provide a calm therapeutic environment.</p>
<p>3. Risk for falls and injury related to falls as evidenced by patient’s overall health</p>	<p>Patient is considered to be a high fall risk due to inability to ambulate without assistance and the condition he is in with his epiglottis care</p>	<p>1. Eliminate hazards in the room 2. education provided on safe ambulation and the use of a call light for assistance</p>	<p>Patient used the call light appropriately and voiced needs when present. Patient allowed for staff to assist in ambulation and transfers to prevent injuries</p>

Concept Map (20 Points):

Subjective Data

Nursing Diagnosis/Outcomes

1. Ineffective gas exchange related to the patient's obstructed airway resulting from his epiglottitis as seen in the patient's labs and ABG's
2. Anxiety related to treatment with Optiflow and placement of NG tube and Tracheostomy
3. Risk for falls and injury related to falls as evidenced by patient's overall health

Objective Data

Patient Information

Nursing Interventions

1. Fall precautions
 2. Assistance with ambulation
 3. Eliminate hazardous items from the room
 4. Education on safe ambulation and the use of a call light
 5. Assistance in performing ADLs
- Patient is 47-year-old male with a history of Epiglottitis. Vital signs are stable as follows:
 BP: 138/74
 Temp: 98.6 F oral
 O2: 95% optiflow 30L/min
 Pulse: 72
