

N431 Care Plan #

Lakeview College of Nursing

Berich Mpoy

Demographics (3 points)

Date of Admission 2/15/23	Client Initials CL	Age 74	Gender F
Race/Ethnicity White	Occupation Retired	Marital Status Married	Allergies Influenza vaccine
Code Status DNR	Height 5'6	Weight 104.004kg	

Medical History (5 Points)

Past Medical History: small bowel obstruction, chronic obstructive pulmonary disease, irritable bowel syndrome, gastroesophageal reflux disease, arthritis, hyperlipidemia, diabetes mellitus, lumbar radiculopathy, tonsillitis, anxiety, degenerative joints, depression, morbid obesity, cholelithiasis and peripheral neuropathy.

Past Surgical History: total knee and hip arthroplasty, operation of the hip joint, arthroplasty of the shoulder, open reduction fracture, gastro reflux operation, laparoscopic cholecystectomy, repair of umbilical hernia, tonsillectomy, arthroplasty thumb-basal joint (left) 10/27/17, laparotomy exploratory 02/15/23, arthroplasty of the shoulder and rotator cuff repair left 10/27/17.

Family History: Mother has vision disorder.

Social History (tobacco/alcohol/drugs including frequency, quantity and duration of use): no tobacco use, uses alcohol on occasion, one to two glasses of wine once or twice a week for 20 years, no drug use.

Assistive Devices: Hoyer lift

Living Situation: Nursing home

Education Level: High school

Admission Assessment

Chief Complaint (2 points): Abdominal pain

History of Present Illness – OLD CARTS (10 points): The patient presented to the hospital after complaining of abdominal pain and asking for water at the nursing home for hours. The patient was brought in by ambulance to the emergency department. the patient's pain began after dinner and did not go away. The patient complained of continuous abdominal pain that was sharp and throbbing. The patient has no relieving or aggravating factors. There is no indication that treatments for chronic abdominal pain were provided for the patient at the nursing home before bringing her that hospital.

Primary Diagnosis

Primary Diagnosis on Admission (2 points): Chronic abdominal pain

Secondary Diagnosis (if applicable): N/A

Pathophysiology of the Disease, APA format (20 points):

Chronic abdominal pain lasts more than three months and is either continuous or intermittent. Chronic abdominal pain is not caused by one specific issue but multiple disorder and or diseases. It can be caused by gastrointestinal diseases and extra-intestinal conditions, such as disorders of gut brain interaction, irritable bowel syndrome, and centrally mediated abdominal pain syndrome (Demitasse., L. 2021). Chronic abdominal pain presents differently depending on affected areas. Chronic abdominal pain can be visceral, somatosensory, and functional. Visceral pain is associated with deep abdominal organs, while functional pain associated with visceral receptors and central hypersensitivity, and somatic pain is associated with nociceptors in superficial tissues (Demitasse., L. 2021). Chronic abdominal pains effects on other body systems are indeterminable unless the disorder or diseases causing the pain's unknown. Chronic

abdominal pain does have an effect on the body overall, it can cause depression, insomnia, stress and anxiety. It can affect emotional and psychological wellbeing of a patient

Signs and symptoms of chronic abdominal pain can vary depending on which receptors are affected and if there are any underlying disorders causing the pain. General signs and symptoms of chronic abdominal pain are sharp or dull pain, fever, night sweats, loss of appetite, weight loss, jaundice, nausea and vomiting, and bloody stools. This particular patient presented with some general signs and symptoms of chronic abdominal pain such as sharp pain, loss of appetite, and nausea. Vital sign abnormalities may not be present because patients with abdominal chronic pain are usually placed on pain medications and other medications.

Laboratory findings in chronic abdominal pain can range from increase in lipase, white blood cells, red blood cells and amylase to an increase in C reactive protein depending on the underlying cause of the pain. According to Demitasse., L. (2021) diagnostic imaging such as ultrasound, computed tomography scan, and magnetic resonance cholangiopancreatography scan are used. A computer tomography scan of the head, abdomen and pelvis was performed on this client. The scan did not reveal a particular cause for chronic abdominal pain in this patient.

Treatments for chronic abdominal pain include surgery, rest, pain medication, and non-steroidal anti-inflammatory drugs. According to Capriotti (2020), the primary goal of management are to relieve abdominal pain, reduce stress, and if constipation is present, a peg tube is placed. In this particular patient constipation medication was provided and a peg tube was placed in place until constipation is relieved. An abdominal exploration surgery oh abdominal laparotomy was conducted to identify the cause of chronic abdominal pain in this patient. The surgery is done while the patient is under general anesthesia. the surgeon examines abdominal organs for the cause of chronic abdominal pain.

Laboratory Data (15 points)

CBC Highlight All Abnormal Labs—Explanations must be in complete sentences and contain in-text citations in APA format.

Lab	Normal Range	Admission Value	Today's Value	Reason for Abnormal Value
RBC	4.0-5.8×10 ⁶ /mcl	5.36mcl	N/A	N/A
Hgb	12.0-15.8g/dl	16.5g/dl	N/A	“Increase levels may indicate congenital heart disease, severe chronic obstructive pulmonary disease, polycythemia Vera, or severe hydration” (Pagana, 2018). In this particular patient her history of severe chronic obstructive pulmonary disease is the cause of elevated hemoglobin levels due diminished oxygen in the body, the body is producing more hemoglobin in order to increase oxygen delivery.
Hct	36.0-47.0%	48%	N/A	Chronic obstructive pulmonary disease has the same effect on hematocrit as it does on hemoglobin. Hematocrit levels are increased in this patient because of her history of chronic obstructive pulmonary disease. According to Pagan, (2018), Increase levels may indicate erythrocytosis, congenital heart disease, polycythemia Vera, severe dehydration, or severe

				chronic obstructive pulmonary disease.
Platelets	140-440k/mcl	487k/mcl	N/A	Elevated platelet count is caused by the patient's history of irritable bowel syndrome. irritation and inflammation can increase platelet production Capriotti (2020)
WBC	4.0-12.0k/mcl	24.3k/mcl	N/A	Elevated white blood count are caused by inflammation and stress caused by chronic abdominal pain. irritation and inflammation can increase platelet production Capriotti (2020).
Neutrophils	40-60%	91.9%	N/A	Infection increases neutrophil counts but the patient showed no sign of infection Capriotti (2020). the elevated neutrophilic levels in the patient are caused by irritation, inflammation and chronic obstructive pulmonary disease. because of chronic obstructive pulmonary disease causing a demand of red blood cells to increase oxygen perfusion throughout the body can cause irritation and inflammation which can lead to the production of white blood cells.
Lymphocytes	19-49%	4.3%	N/A	low lymphocytes caused by poor nutrition call mom infections, diseases, medicines, and other factors Capriotti (2020). Low lymphocytes In this patient are caused by poor nutrition.
Monocytes	3.0-13.0%	3.5%	N/A	N/A
Eosinophils	0.0-8.0%	0.3%	N/A	N/A
Bands	0.0-10.0%	N/A	N/A	N/A

Chemistry Highlight All Abnormal Labs—Explanations must be in complete sentences and contain in-text citations in APA format.

Lab	Normal Range	Admission Value	Today's Value	Reason For Abnormal
Na-	134-144mmol/L	137mmol/l	N/A	N/A

K+	3.5-5.1mmol/L	3.5mmol/l	N/A	N/A
Cl-	98-107mmol/L	102mmol/l	N/A	N/A
CO2	21-31mmol/L	23mmo/l	N/A	
Glucose	70-99mg/dL	158mg/dl	N/A	The patient's history of hyperlipidemia and morbid obesity is the cause of high glucose. The patient is also immobilized which can cause high glucose levels. According to Pagan, (2018), hyperlipidemia, immobility and morbid obesity can cause high glucose levels.
BUN	7-25 mg/dL	15mg/dl	N/A	
Creatinine	0.50-1.20mg/dL	0.91mg/dl	N/A	
Albumin	3.5-5.7g/dL	3.3g/dl	N/A	Low albumin level caused by digestive diseases and malabsorption and malnutrition in this patient (MedlinePlus, 2021).
Calcium	8.6-10.3mg/dL	9.4mg/dl	N/A	
Mag	1.6-2.6mg/dL	1.5mg/dl	N/A	According to Pagan, (2018), low magnesium levels are caused by malnutrition resulting in poor intake, and malabsorption. Due to the patient experiencing abdominal pain, low magnesium is due to malnutrition because the patient could not eat with chronic abdominal pain.
Phosphate	2.4-4.5unit/L	N/A	N/A	N/A
Bilirubin	0.3-1.0mg/dL	1.6mg/dl	N/A	Low bilirubin levels in this patient is caused by the patient's home medications such as NSAIDs and barbiturates (Pagana, 2018).
Alk Phos	34-104units/L	202unit/l	N/A	According to MedlinePlus, (2021), If ALP levels are elevated but liver enzymes are not elevated the most likely cause of ALP elevation is

				bone disorders. If liver enzymes are high, then ALP levels then the problem is your liver. high ALP levels in this patient indicate the patient have bone disorder. the cause of elevated ALP level in this patient is degenerative joints disorder end arthritis.
AST	13-39units/l	14unit/l	N/A	N/A
ALT	7-52unit/l	12uni/l	N/A	N/A
Amylase	29-103 unit/l	N/A	N/A	N/A
Lipase	11-82unit/l	492unit/l	N/A	N/A
Lactic Acid	<2.5mmol/l	1.8mmol/l	N/A	N/A
Troponin	0-0.04mg/dl	0.0033mg/dl	N/A	N/A
CK-MB	5-25ug/l	N/A	N/A	N/A
Total CK	22-198 u/l	N/A	N/A	N/A

Other Tests **Highlight All Abnormal Labs**—Explanations must be in complete sentences and contain in-text citations in APA format.

Lab Test	Normal Range	Value on Admission	Today's Value	Reason for Abnormal

Jones, D.W. (2020). Nurse's drug handbook. (A. Bartlett, Ed.) (19th ed.). Jones & Bartlett Learning.

Diagnostic Imaging**All Other Diagnostic Tests (5 points):**

A CT scan of the abdomen and pelvis with contrast was done on 2/15/23. The test showed that patient had a fatty liver with infiltration. The patient has a negative Murphy sign and her biliary ducts normal. She has no sign of stones or dilation. The patient's pancreas was not visualized with certainty.

A CT scan of the brain of the head without contrast was done on 2/15/23. The test showed mild prominence of the sulci and ventricles. The test also showed that there were no extra axial fluid collection and no masses or midline shifts. Moderate patchy white matter with hypodensity consistent with small vessel extremity changes were noted during the test.

An X-ray of the chest with one view was conducted. The X-ray showed low lung volumes with heart enlargement and central bronchovesicular crowding with no concerning infiltrate. The slight blunting of the left lateral costophrenic sulcus may be related to scarring or trace pleural fluid. The scan also showed that the patient had known pneumothorax and that the bowel of the upper abdomen was the standard due to gas.

Diagnostic Test Correlation (5 points):

A CT scan of the abdomen and pelvis was done to examine the cause of chronic abdominal pain the patient was experiencing. The CT scan of the stomach is performed to assess the abdomen and pelvis for tumors, lesions, injuries, bleeding, unexplained abdominal pain, and obstructions.

A CT scan of the abdomen and pelvis can diagnose kidney stones, hernias, aneurysms, infections, pancreatitis, and many other conditions (Capriotti, 2020).

The CT scan of the head without contrast was conducted to investigate altered mental status in the patient. According to Capriotti (2020), a non-contrast head CT is conducted to detect any acute hemorrhage in the brain. the scan also assesses head injuries, severe headaches, dizziness and other symptoms of aneurysms.

An X-ray of the chest was conducted to examine the chest pain the patient was experiencing. A chest X-ray is used to diagnose conditions that affecting the chest it's contacts and all nearby structures, such as the chest wall, the bones around, and also the structures contained within the thoracic cavity (Capriotti, 2020). The lungs, heart, great vessels also assessed during an chest X-ray. The tests diagnosis for disorders such as pneumonia, congestive heart failure, and other conditions related to the hot and lungs.

Hospital Medications (5 required)

Brand/Generic	Enoxaparin/ Lovenox	Gabapentin/ Neurontin	Acetaminop hen /Tylenol	Omeprazole/ Prilosec	Ondansetro n hydrochlori de/ Zofran ODT
Dose	40mg	100 mg	325 mg	20 mg	4 mg
Frequency	Daily	Twice a day	every four hours	Once-daily	every eight hours
Route	subcutaneou s	oral	oral	oral	oral
Classification	Pharmacolo gical class;	Anticonvuls ant	Antipyretic, nonopioid analgesic.	Antiulcer	Antiemetic. (Jones 2020)

	Lower molecular weight heparin. Therapeutic class; anticoagulant.		(Jones 2020)		
Mechanism of Action	Enoxaparin is a coagulation inhibitor. It rapidly binds with antithrombin 3 and inactivates clotting factors (Jones, 2020).	“Gabapentin is structurally like gamma-aminobutyric acid (GABA), the main inhibitory neurotransmitter in the brain. Although gabapentin’s exact mechanism of action is unknown, Gaba inhibits the rapid firing of neurons associated with seizures. it also may prevent exaggerated responses to painful stimuli and pain-related responses to a normally innocuous stimulus to account for its	“Inhibits the enzyme cyclooxygenase, blocking prostaglandin production and interfering with pain impulse generation in the peripheral nervous system. Acetaminophen also acts directly on the temperature-regulating center in the hypothalamus by inhibiting the synthesis of prostaglandin E2” (Jones, 2020).	“Omeprazole interferes with gastric acid secretion by inhibiting the hydrogen potassium adenosine triphosphatase enzyme system, or protein pump, in gastric parietal cells. Normally, the protein pump uses energy from the hydrolysis of adenosine triphosphate to drive hydrogen and chloride out of the parietal cells and into the stomach lumen in exchange for potassium, which leaves the stomach lumen and enters parietal cells; after this exchange, hydrogen and chlorine combined in	“Blocks serotonin receptors centrally in the chemoreceptor trigger zone and peripherally at vagal nerve terminals in the intestine. This action reduces nausea and vomiting by preventing serotonin release in the small intestine (probable cause of chemotherapy and radiation-induced nausea and vomiting) and blocking signals to the CNS. Ondansetron May also

		effectiveness in relieving postherpetic neuralgia and restless legs syndrome symptoms.” (Jones, 2020).		the stomach to form hydrochloric acid. Omeprazole irreversibly blocks the exchange of intracellular hydrogen and extracellular potassium. By preventing hydrogen from entering the stomach lumen, omeprazole keeps additional hydrochloric from forming” (Jones 2020).	bind to other serotonin receptors and two mu-opioid receptors” (Jones 2020).
Reason Client Taking	The patient is taking this medication to prevent clotting.	The patient is taking this medication to reduce the risk for seizure.	The patient is taking this medication for pain.	The patient is taking this medication for gastroesophageal reflux.	The patient is taking this for nausea and vomiting.
Contraindications (2)	This medication is contraindicated in patients who eat pork products and those with active major bleeding or who have a history of immune-mediated heparin-induced thrombocyto	hypersensitivity to gabapentin or its components. (Jones, 2020).	hypersensitivity to acetaminophen or its members, severe hepatic impairment, severe active liver disease. (Jones, 2020)	hypersensitivity to omeprazole, substituted benzimidazoles or their components, and concurrent therapy with rilpivirine-containing products (Jones 2020).	Congenital long QT syndrome and hypersensitivity to ondansetron or its components . (Jones 2020)

	penia (Jones, 2020).				
Side Effects/Adverse Reactions (2)	Confusion and spinal hematoma.	Agitation, anxiety, amnesia, depression, angina, hypertension, abnormal vision, jaundice, nausea, and anemia. (Jones, 2020).	Agitation, hypertension, stridor, abdominal pain, hypoglycemic coma, and peripheral edema (Jones, 2020).	hypoglycemia, agitation, regurgitation, constipation, back pain, bone fracture, bronchospasms, and abdominal pain (Jones 2020).	bronchospasms, abdominal pain, prolonged QT interval, wonder, and tachycardia. (Jones 2020)
Nursing Considerations (2)	This medication should be used cautiously in patients with diabetic retinopathy, hepatic or renal impairment, GI hemorrhaging, ulceration, and uncontrolled hypertension (Jones, 2020).	Administer with food or without food. Giving with food will reduce gastrointestinal upset (Jones, 2020). Report observation of depression, suicidal thoughts, all unusual behavior (Jones, 2020).	“Use acetaminophen cautiously in patients with hepatic impairment or active hepatic disease, alcoholism, chronic malnutrition, severe hypovolemia, or severe renal impairment” (Jones, 2020). “Know that before and during long term therapy including parenteral therapy, liver function test	Give omeprazole before meals but preferably in the morning for once daily dosing. If needed also give an anti-acid, as prescribed (Jones, 2020). Monitor patients’ urine output because omeprazole may cause acute intestinal nephritis. notify provider if urine output decreases or there is blood in patients’ urine (Jones, 2020).	consider that if hypokalemia or hypomagnesium is present, these electrolyte imbalances should be corrected before medication administered because of increased risk for QT interval prolongation, which could predispose the patient to develop torsade de pointes (Jones, 2020). Monitor the patient

			<p>results, including AST, ALT, bilirubin, and creatinine levels, as ordered must be monitored because I see the metaphor may cause hepatotoxicity. Ensure that daily dose of acetaminophen from all sources does not exceed maximum daily limits” (Jones, 2020).</p>		<p>closely for signs and symptoms of hypersensitivity to medication because hypersensitivity reactions, including anaphylaxis and bronchospasm could occur (Jones, 2020).</p>
<p>Key Nursing Assessment(s)/ Lab(s) Prior to Administration</p>	<p>Before administering enoxaparin assess for signs and symptoms of bleeding or hemorrhaging (Jones, 2020).</p> <p>Review patients complete blood cell and platelet</p>	<p>Instruct patient to swallow extended-release tablets without breaking, crushing, dissolving, or chewing (Jones, 2020).</p> <p>Ensure blood pressure is</p>	<p>Assess for any allergies to acetaminophen or its component (Jones, 2020).</p> <p>Assess for pain by having the patient rate on a scale of 1 to 10, and describe</p>	<p>Assess for any allergies to omeprazole and its components (Jones, 2020).</p> <p>Monitor for other CNS side effects such as drowsiness, fatigue, weakness, headache, and report severe or prolonged</p>	<p>Assess for any allergies to ondansetron and its components (Jones, 2020).</p> <p>Assess for nausea, vomiting, abdominal distention call mom and bowel sounds</p>

	count (Jones, 2020).	within normal range.	characteristics, duration, and frequency before administering (Jones, 2020). medication hearing	effects before administering omeprazole (Jones, 2020).	prior to administering medication (Jones, 2020).
Client Teaching Needs (2)	<p>avoid activities that may increase your risk for bleeding or injury. Use extra care to prevent bleeding while shaving or brushing your teeth (Jones, 2020).</p> <p>This medication will reduce or prevent blood clots from forming (Jones, 2020).</p>	<p>Do not suddenly stop gabapentin due to the increased risk of seizure (Jones, 2020).</p> <p>Teach the patient to avoid driving and activities that require concentration until the effects have been evaluated (Jones, 2020).</p>	<p>Instruct the patient not to take more than 4000 milligrams of acetaminophen per 24 hours (Jones, 2020).</p> <p>Teach patient to recognize signs of hepatotoxicity, such as bleeding, easy bruising, and Malaise, which commonly occurs with chronic overdose. H (Jones, 2020).</p>	<p>Advise patient to notify provider immediately about abdominal pain or diarrhea. Also tell patient to stop taking omeprazole and notify provider if a rash or joint pain occurs (Jones, 2020).</p> <p>Educate patient to avoid alcohol, aspirin products, ibuprofen, and foods that may increase gastric secretions during therapy period tell patient to notify all provider about omeprazole use (Jones, 2020).</p>	<p>Educate the patient to place disintegrating tablet on the tongue immediately and allow it to dissolve on his tongue before swallowing (Jones, 2020).</p> <p>“Advise patient to immediately report signs and symptoms of hypersensitivity, such as rash” (Jones, 2020).</p>

Assessment

Physical Exam (18 points) – HIGHLIGHT ALL PERTINENT ABNORMAL FINDINGS

<p>GENERAL: Alertness: Orientation: Distress: Overall appearance:</p>	<p>Patient was alert and oriented X4 with no sign of distress. The patient is alert and oriented to person, place and time. The patient was well-groomed. The patient’s hygiene is appropriate for current situation.</p>
<p>INTEGUMENTARY: Skin color: Character: Temperature: Turgor: Rashes: Bruises: Wounds: . Braden Score: Drains present: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Type:</p>	<p>The patient’s skin is dry. The patient skin temperature was warm with elastic skin turgor. No rashes or bruises were present during the patient assessment. The patient’s braden score is 12. The patient’s skin was appropriate for ethnicity.</p>
<p>HEENT:</p>	<p>The patient's head is normal cephalic, and the</p>

<p>Head/Neck: Ears: Eyes: Nose: Teeth:</p>	<p>neck is symmetrical with the trachea at the midline. All pulses are +3. There are no scarring, depressions, or masses. The patient's hair has a normal texture and is evenly distributed. The patient's eyes are symmetrical, with no sign of exudates or hemorrhage. The eyes are perilla, and extraocular movements are intact. The eyes have no sign of nystagmus. The ears are symmetrical with no sign of discharge and no tenderness. That tympanic membrane is normal in appearance, and hearing is intact. The nasal mucosa is pink and moist. The nasal septum is midline, and the nares are patent bilaterally. The patient's oral mucosa is pink and moist..</p>
<p>CARDIOVASCULAR: Heart sounds: S1, S2, S3, S4, murmur etc. Cardiac rhythm (if applicable): Peripheral Pulses: Capillary refill: Neck Vein Distention: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Edema Y <input checked="" type="checkbox"/> N <input type="checkbox"/> Location of Edema:</p>	<p>The patient presented with s1 and s2 heart sounds. Peripheral pulses were +3. Sinus rhythm. Patient capillary refill was less than 2 and the patient had no neck vein distention. The patient was a fall risk, and the fall score was 55. Pitting edema +2 of the legs.</p>
<p>RESPIRATORY: Accessory muscle use: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Breath Sounds: Location, character</p>	<p>Breath sounds are clear bilateral. Respirations regular. Regular breathing pattern. Breath sound are slightly diminished with slight wheezing. Respirations 20 per min. No muscle accessory use.</p>
<p>GASTROINTESTINAL: Diet at home: Current Diet Height: Weight: Auscultation Bowel sounds: Last BM: Palpation: Pain, Mass etc.: Inspection: Distention: Incisions: Scars: Drains: Wounds: Ostomy: Y <input type="checkbox"/> N <input checked="" type="checkbox"/></p>	<p>Regular home diet. Clear liquid diet. 167.64cm 104.004kg Active bowel sounds in all four quadrants. This morning. No palpations patient had surgery. No distention of the abdomen Vertical incision on the abdomen No scars present. No drains present. No wounds present. No Ostomy.</p>

<p>Nasogastric: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Size: Feeding tubes/PEG tube Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Type:</p>	<p>No Nasogastric tube in place. Feeding tube removed, patient is now NPO.</p>
<p>GENITOURINARY: Color: Character: Quantity of urine: Pain with urination: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Dialysis: Y <input type="checkbox"/> N <input checked="" type="checkbox"/> Inspection of genitals: Catheter: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> Type: Size:</p>	<p>Dark yellow Clear 200ml Patient stated no pain with urination. No dialysis in place N/A N/A</p>
<p>MUSCULOSKELETAL: Neurovascular status: ROM: Supportive devices: Strength: ADL Assistance: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> Fall Risk: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> Fall Score: Activity/Mobility Status: Independent (up ad lib) <input type="checkbox"/> Needs assistance with equipment <input type="checkbox"/> Needs support to stand and walk <input type="checkbox"/></p>	<p>Nail beds normal, no sign of clubbing. Active and passive range of motion. The patient acts as if pain in lower legs when the legs are moved but states she feels no pain. Patient is a Hoyer lift and utilizes grab to reach items. The patient has 5+ strength in both upper and lower extremities. The patient requires full assistance activities of daily living. The patient fall score is 55. Patient does not have full range of motion in both lower extremities. Patient requires assistance bending lower extremities. Patient has active and passive range of motion in all extremities. Patient is a Hoyer lift does not stand or walk and needs assistance with certain equipment.</p>
<p>NEUROLOGICAL: MAEW: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> PERLA: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> Strength Equal: Y <input checked="" type="checkbox"/> N <input type="checkbox"/> if no - Legs <input type="checkbox"/> Arms <input type="checkbox"/> Both <input checked="" type="checkbox"/> Orientation: Mental Status: Speech: Sensory: LOC:</p>	<p>The patient is oriented to person, place, situation, and time. The patient's pupils are equal, reactive to light, and accommodates. The patient has 5+ strength in both lower and upper extremities. The patient is able to follow commands and the patient's memory is intact. and speech was soft and clear. The patient is awake and answering questions appropriately. Alert and oriented times 4. Sensory is intact.</p>

<p>PSYCHOSOCIAL/CULTURAL: Coping method(s): Developmental level: Religion & what it means to pt.: Personal/Family Data (Think about home environment, family structure, and available family support):</p>	<p>The patient's coping method is watching TV and talking to her roommate at the nursing home. The patient uses jokes to cope. The patient can read and write and can form full structured sentences. She also has the capability of making a fully informed decision. The patient is Christian, she believes that we should treat others as we treat ourselves. The patient leaves at a nursing home. The patient did not want to disclose any more personal information.</p>

8:20	Numerical scale	N/A	N/A	N/A	N/A
10:45	Numerical scale	N/A	N/A	N/A	N/A

IV Assessment (2 Points)

IV Assessment	Fluid Type/Rate or Saline Lock
Size of IV: Location of IV: Date on IV: Patency of IV: Signs of erythema, drainage, etc.: IV dressing assessment:	18-gauge saline locked Peripheral/Double central IV 02/20/23 Patent No sign erythema, drainage present. Dry and clean dressing.

Intake and Output (2 points)

Intake (in mL)	Output (in mL)
473.176 ml of chicken broth and 570ml of sprite.	Incontinent of urine times 1 Incontinent of stool times 1

Nursing Care

Summary of Care (2 points)

Overview of care: The student arrived at the patient’s room around 730. The student introduced himself to the patient and remained outside waiting for the nurse. when the students nurse arrived, the student and nurse entered the patient's room and completed a full head to toe assessment of the patient. The student gave the patient a bed bath around the morning time. The patient was glad the student was there to give her a bed bath. the nurse asks the patient if she was having pain, but the patient stated she has zero pain. The student took the patients vital signs, and all vital signs were within normal range. Later, the day the student and instructor provided the patient with daily medications. The patient also asked for more blankets, so the student provided the patient with more blankets. Around 11:20 the student took the patients vital signs again, the patient's blood pressure was a slightly elevated. Patients’ other vital signs were within normal range. Patient requested to be fed around this time and the student fed the patient the first bowl of chicken broth and provided the patient with a sprite.

Procedures/testing done: During the students' clinical hours, no procedures of testing was done.

Complaints/Issues: The patient did not complain of anything, when the nurse was assessing the patient's edema on the lower legs. The patient ground each time the nurse assessed each leg. When asked if she felt any pain, the patient denied any pain.

Vital signs (stable/unstable): When the students took the patient's first set of vital signs, all vital signs were within normal range. The second set of vital signs taken around 11:20 showed that the patient's blood pressure was slightly increased.

Tolerating diet, activity, etc.: The patient was placed on an NPO diet but as of this morning the NPO's order was pulled. The patient is now on a clear liquid diet. patient was provided with chicken broth and Sprite. The patient is tolerating this diet without any complications. The patient is bed rest, the student provided the patient with a bed bath. Patient is a Hoyer lift. The patient spends most of her time watching TV.

Physician notifications: Physician ordered that the patient be placed on a clear liquid diet. No other orders during the students' clinical hours.

Future plans for client: Future plans are to discharge the patient to a nursing home after the patient is assessed by the physician or provider.

Discharge Planning (2 points)

Discharge location: Nursing home in Mattoon

Home health needs (if applicable): N/A

Equipment needs (if applicable): N/A

Follow up plan: Patient will be discharged to a nursing home. She will receive support with activities of daily living.

Education needs: Educate patient about chronic abdominal pain and signs and symptoms to watch for. Educate patient about avoiding a diet high in sodium and participating in passive and active range of motion to avoid further deterioration of range of motion. Educate patient on using the call line to ask for assistance in turning to avoid pressure ulcers. Educate patient about participating in self-care activities.

Nursing Diagnosis (15 points)

Must be NANDA approved nursing diagnosis and listed in order of priority

<p>Nursing Diagnosis</p> <ul style="list-style-type: none"> • Include full nursing diagnosis with “related to” and “as evidenced by” components • Listed in order by priority – highest priority to lowest priority pertinent to this client 	<p>Rationale</p> <ul style="list-style-type: none"> • Explain why the nursing diagnosis was chosen 	<p>Interventions (2 per dx)</p>	<p>Outcome Goal (1 per dx)</p>	<p>Evaluation</p> <ul style="list-style-type: none"> • How did the client/family respond to the nurse’s actions? • Client response, status of goals and outcomes, modifications to plan.
<p>1. Excess fluid volume related to a compromise regulatory mechanism as evidenced by pedal edema (Phelps, L. 2020).</p>	<p>Patient has 2+ pitting edema in both lower legs.</p>	<p>1. Other References (APA):

Phelps, L. L. (2020). *Sparks & Taylor's Nursing Diagnosis Reference Manual* (11th ed.).

Wolters Kluwer.

Concept Map (20 Points):

Subjective Data

The patient stated that her last bowel movement was this morning.
 CT of the abdomen and pelvis with contrast 2/15/23. CT of the abdomen showed a fatty liver with infiltration.
 The patient stated that she has not had food since she was admitted but is hungry and would like some food.
 Dark yellow urine

Objective Data

Braden score: 12

72-year-old Caucasian female with the history of small bowel obstruction, irritable bowel syndrome, chronic obstructive pulmonary disease, and morbid obesity. Patient was admitted for chronic abdominal pain.

Client Information

Alert and oriented times 4.

1. Excess fluid volume related to a compromise regulatory mechanism as evidenced by pedal edema.
 Outcome: Pitting edema will decrease to +1 after one day. Patient will restrict from high sodium diet.
2. Risk for impaired skin integrity related to pressure over bony prominence as evidenced by immobility.
 Outcome: The patient will not exhibit skin breakdown (Phelps, L. 2020).
 Patient skin remains dry and intact
3. Impaired bed mobility related to morbid obesity has evidenced by partial range of motion.
 Outcome: Patient maintains range of motion on increased assistance. Patient is using the call light to request help with ADLs (Phelps, L. 2020).
 Patient will begin sitting more with one hand on upper arm (Phelps, L. 2020) and her chair will increase as she continues to drink nutritional drinks and eat traditional food.
 Patient will participate in helping with completing activities of daily living.

Nursing Diagnosis/Outcomes

Nursing Interventions

1. Administer diuretics as prescribed.
 Educate patient that large amounts of sodium will cause the body to retain water to dilute it which causes fluid overload. Encourage a low sodium diet.
2. Position patient for comfort and minimal pressure on Bony prominences. Change patient's position at least every two hours (Phelps, L. 2020).
 Keep linen dry, clean, and free from wrinkles or charms change wet bed linens and re-circumference pads immediately (Phelps, L. 2020).
3. Perform range of motion exercises to affect the joints, unless contraindicated. Encourage patient to perform activities slightly above their range of help with ADLs (Phelps, L. 2020).
 Encourage patient to sit in chair with one hand on upper arm (Phelps, L. 2020) and her chair will increase as she continues to drink nutritional drinks and eat traditional food.
 Provide patient with ample time to help complete activities of daily living.
4. Provide patient with socialization opportunities and provide patient with supplemental nutritional drinks or food.
