ATI Remediation

Anatomy & physiology

How will it improve me as a nurse?

1. Immunological system: It helps me understand how the body fights infection so I can recognize infection early and give proper prevention and teaching.
2. Hematological system: It teaches me how blood cells and clotting work, which helps me identify anemia, bleeding risks, and prioritize safe interventions.
3. Endocrine system: It improves my ability to care for patients with diabetes, thyroid disorders, and hormonal imbalances and recognize abnormal lab values.
4. Gastrointestinal system: It helps me understand digestion and nutrition so I can assess for GI disorders, dehydration, and complications and teach about diet.
5. Reproductive system: It helps me provide sensitive and accurate care related to pregnancy, sexual health, and reproductive disorders while protecting patient comfort and privacy.
