

**N321 CARE PLAN #1**

Emily Hines

Lakeview College of Nursing

N321: Adult Health I

Kristal Henry

2/27/2026

### Demographics

<b>Date of Admission</b> 02/22/2026	<b>Client Initials</b> G.J.	<b>Age</b> 64 years old	<b>Biological Gender</b> Male
<b>Race/Ethnicity</b> White/Caucasian	<b>Occupation</b> Unemployed	<b>Marital Status</b> Single	<b>Allergies</b> No known allergies
<b>Code Status</b> Full Code	<b>Height</b> 5 feet 5 inches (165.1 cm)	<b>Weight</b> 75.6 kg (166 lbs 10.7 oz)	

### Medical History

**Past Medical History:** Alcohol dependence, anemia, chronic pain, colonic polyp, depressive disorder, dermatitis, hyperlipidemia, hypertension, hypokalemia, scabies, tobacco dependence.

**Past Surgical History:** Patient states he remembers he had a right knee surgery in the past but could not remember when it was.

**Family History:** Breast cancer from mother; both mother and father were alcoholics; heart disease from paternal aunt and uncle.

**Social History (tobacco/alcohol/drugs including frequency, quantity and duration of use):**

Patient states he has never used “smokeless tobacco or vape”. Patient stated he smokes 16-17 cigarettes daily for the past 30 years, and his last cigarette was this past Friday night (02/20/26).

Patient stated he used to drink a 5th of vodka everyday, but quit drinking four years ago. The patient stated he uses amphetamines, cannabis, and cocaine everyday.

**Education:** High school diploma

**Living Situation:** Patient states he lives by himself.

**Assistive devices:** Patient stated he does not use any assistive devices.

### **Admission History**

**Chief Complaint:** Headache, generalized weakness, fatigue, chills, and abdominal pain

**History of Present Illness (HPI)– OLD CARTS:** The patient stated he started to have symptoms Saturday morning (02/21/26). The patient stated “it was mostly in my stomach and chest area” and then showed the student nurse his stomach and chest. The patient stated “I have been having these symptoms for three days”. The patient stated “it felt like the flu” and stated “I had weakness, didn’t want to eat, was sleepy, thirsty, and had an upset stomach”. The patient stated he did not know anything that aggravated his symptoms. The patient stated he did not know anything that relieved his symptoms. The patient stated he thought it was the flu so he increased his fluids and denied taking any over the counter medications for the treatment of his symptoms. The patient rated the severity of his symptoms 6/10 on a word scale.

### **Admission Diagnosis**

**Primary Diagnosis:** Cellulitis

**Secondary Diagnosis (if applicable):** N/A

### **Pathophysiology**

Cellulitis is a bacterial skin infection that happens when an injury to the skin allows mainly pathogens like *Streptococcus* or *Staphylococcus aureus* to enter and release toxins into the subcutaneous tissues (Hinkle & Cheever, 2026). After the bacteria have penetrated the skin, an inflammatory response begins and chemical mediators, like cytokines, and neutrophils are recruited to the affected area (Hinkle & Cheever, 2026). This leads to increased blood flow, increased capillary permeability, dilation of the blood vessels, and congestion of local tissues, which causes the redness, swelling, pain, warmth in the area, and loss of function (Hinkle & Cheever, 2026).

This infection of the skin shows signs and symptoms of redness in a specific area, induration, elevated white blood cell count, swelling, heat in area, and tenderness in the skin affected (Capriotti & Frizzell, 2023). These symptoms correlate with the patient's left lower leg being red, taut, warm to the touch, and an elevated white blood cell count noted. Other signs and symptoms seen with infection of the skin are elevated body temperature, chills, and sweating (Hinkle & Cheever, 2026). The skin is a protective layer of the body that prevents the normal skin flora and pathogens from going into the subcutaneous tissue and lymphatic system (Hinkle & Cheever, 2026). When there is an injury to the skin, pathogens can enter the dermis and subcutaneous tissue and cause an infection in these tissue layers and eventually lead to cellulitis (Hinkle & Cheever, 2026). The patient presenting with elevated white blood cell count levels indicates the patient has an infection in his body. When an infection is seen in the body, a culture is needed to assess what type of pathogen it is so we know how to treat the infection. This would explain why the patient has an order to hold his antibiotics until his blood cultures and lab analyses are complete. The patient also has an order for a complete blood count with a differential, which would show his red blood cells, white blood cells, and platelets. If not treated soon cellulitis can go deeper into the tissue layers and eventually go in the bloodstream and cause sepsis. Sepsis is an infection of the bloodstream that overwhelms the immune system and causes a severe compromise of multiple organs (Capriotti & Frizzell, 2023). Sepsis is seen in signs and symptoms like a low blood pressure, high heart rate, low pH levels of the blood, and dilation of blood vessels (Capriotti & Frizzell, 2023). Patients with cellulitis commonly present with a poorly defined area of skin with redness, warmth, swelling, pain, and tenderness upon palpation (Capriotti & Frizzell, 2023). Other symptoms that may also be present are an elevated temperature, general feeling of discomfort, and fatigue, which shows conditions that affect the

entire body in moderate to severe cases (Capriotti & Frizzell, 2023). These symptoms explain why the patient presented with redness and warmth upon palpation to the skin on his left lower leg, and had a general feeling of discomfort and fatigue upon admission. Patients with two or more signs of infection, such as a temperature above 100.4 °F, pulse greater than ninety beats a minute, respiratory rate over twenty breaths a minute, white blood cell count above 12,000/mm<sup>3</sup>, or a white blood cell count below 4,000/mm<sup>3</sup>, need to be admitted to the hospital and started on systemic antibiotics (Hinkle & Cheever, 2026). The patient presented with a temperature of 98.6°F, respiratory rate of twenty breaths per minute, pulse of eighty-five beats per minute, blood pressure of 147/74 mm/Hg, oxygen saturation of 100% on room air, and an elevated white blood cell count above 24.74/mm<sup>3</sup> upon admission and a current elevated white blood cell count of 16.33/mm<sup>3</sup>. Even though the patient did not meet all of the signs, he was admitted to the hospital for intravenous antibiotics. Mild cellulitis can be treated with oral antibiotics, but if the cellulitis is severe it is treated with antibiotics intravenously (Hinkle & Cheever, 2026). This correlates to the patient having the medication cefazolin because it is an antibiotic and the patient is receiving this medication intravenously. To prevent more than one cellulitis episode, the healthcare team must identify where the pathogen entered the skin, identify which antibiotic is best for the patient, and complete all antibiotics given (Hinkle & Cheever, 2026). The most common sites of entry for microbes that need to be carefully examined are fissures and ulcers between the toes (Hinkle & Cheever, 2026). Other sites where the pathogen can come in are places where drugs are injected, contusions, abrasions, ulcers, ingrown toenails, and hammer toes (Hinkle & Cheever, 2026). This would explain the way the pathogen came in, due to the patient's thick bilateral toenails and thick flaky skin around the toes and on the sole of bilateral feet.

Deep vein thrombosis is commonly unilateral and shows signs and symptoms of tenderness, redness, warm to the touch, and swelling in the lower extremities (Capriotti & Frizzell, 2023). Patients commonly show risk factors for deep vein thrombosis, like a history of difficulty moving, active cancer, or a family history of blood clots forming in the deep veins (Capriotti & Frizzell, 2023). The reason why the healthcare staff thought he had a deep vein thrombosis was because the patient has a history of his mother having breast cancer and he came in with a reddened, swollen leg. Deep vein thrombosis almost never manifests with elevated temperatures or elevated white blood cell count, but they can be present (Capriotti & Frizzell, 2023). Even though the patient had an elevated white blood cell count, they did the ultrasound of his lower extremity to verify if it was not a clot. To evaluate and diagnose, an ultrasound imaging is used to confirm the diagnosis (Capriotti & Frizzell, 2023). This would explain why the left duplex ultrasound of the patient's lower extremity veins was done. A d-dimer is a test for assessing a blood clot (Pagana et al., 2025). The patient tested positive for the d-dimer, which was the reason they did the left ultrasound duplex in his left lower extremity and the angio chest CT with and without contrast.

### Laboratory/Diagnostic Data

Lab Name	Admission Value	Today's Value	Normal Range	Reasons for Abnormal
Sodium	130 mEq/L	132 mEq/L	136-145 mEq/L (Pagana et al., 2025)	The patient probably has decreased sodium levels due to stating before his admission he did not want to eat a lot and mostly drank water which could dilute the sodium (Pagana et al., 2025).
Potassium	3.7 mEq/L	3.3 mEq/L	3.5-5 mEq/L (Pagana et al., 2025)	The patient probably has an abnormally low potassium due to his past medical history of hypokalemia, his statement of not wanting to eat, and a side effect of low potassium due to his hydrochlorothiazide medication (Pagana et al., 2025).

Venous CO2	20 mEq/L	21 mEq/L	23-30 mEq/L (Pagana et al.,2025)	The patient probably has an abnormally low venous CO2 due to a lack of dietary intake (Pagana et al., 2025).
Blood Creatinine	0.73 mg/dL	0.56 mg/dL	0.6-1.2 mg/dL (Pagana et al., 2025).	The patient has a slightly low creatinine, most likely due to malnutrition or low muscle mass (Pagana et al., 2025).
BUN/Creatinine Ratio	15 mg/dL	27 mg/dL	10-20 mg/dL (Pagana et al., 2025)	The patient probably has an abnormally elevated BUN/creatinine ratio due to his reduction in body fluid volume (Pagana et al., 2025).
Glucose	98 mg/dL	132 mg/dL	82-115 mg/dL (Pagana et al., 2025)	The patient probably has an abnormally elevated glucose due to an acute stress reaction (Pagana et al., 2025).
Calcium	8.8 mg/dL	8.2 mg/dL	9-10.5 mg/dL	The patient probably has an abnormally low

			(Pagana et al., 2025)	calcium due to poor dietary intake (Pagana et al., 2025).
WBC	24.74/mm <sup>3</sup>	16.33/mm <sup>3</sup>	5,000-10,000/mm <sup>3</sup> (Pagana et al., 2025)	The patient probably has an abnormally elevated white blood cell count due to his diagnosis of cellulitis (Pagana et al., 2025).
RBC	4.40x10 <sup>6</sup> /μL	3.66x10 <sup>6</sup> /μL	4.7-6.1x10 <sup>6</sup> /μL (Pagana et al., 2025)	The patient probably has an abnormally low red blood count due to his alcohol intake and poor dietary intake. (Pagana et al., 2025).
Hemoglobin	13.8 g/dL	11.4 g/dL	14-18 g/dL (Pagana et al., 2025)	The patient probably has abnormally decreased hemoglobin due to his alcohol intake and poor dietary intake (Pagana et al., 2025).
Hematocrit	41.1%	34.8%	42%-52% (Pagana et	The patient probably has abnormally decreased

			al., 2025)	hematocrit due to his alcohol intake and poor dietary intake (Pagana et al., 2025).
Neutrophils	87.2%	86.1%	55-70% (Pagana et al.,2025)	The patient probably has abnormally elevated neutrophils due to his acute cellulitis (Pagana et al., 2025).
Lymphocytes	5.2%	6.6%	20-40% (Pagana et al., 2025)	The patient probably has abnormally low lymphocytes due to his infection of the tissues and possible sepsis (Pagana et al., 2025).
Immature Granulocytes	1.0%	0.9%	0%-2% (Pagana et al., 2025)	The patient probably has an abnormal immature granulocytes due to his acute bacterial infection (Pagana et al., 2025)
Absolute Neutrophils	21.56/mm <sup>3</sup>	14.05/mm <sup>3</sup>	2500-8000 /mm <sup>3</sup> (Pagana et	The patient probably has abnormal absolute neutrophils due to his

			al., 2025)	acute cellulitis (Pagana et al., 2025).
Absolute Monocytes	1.57/mm <sup>3</sup>	0.80/mm <sup>3</sup>	100-700 /mm <sup>3</sup> (Pagana et al., 2025)	The patient probably has low absolute monocytes due to his infection (Pagana et al., 2025).
Absolute Immature Granulocytes	0.24 10 <sup>3</sup> /mm <sup>3</sup>	0.15 10 <sup>3</sup> /mm <sup>3</sup>	0-0.10 10 <sup>3</sup> /mm <sup>3</sup> (Pagana et al., 2025)	The patient has elevated absolute immature granulocytes due to his bacterial infection (Pagana et al., 2025).
Protein, random urine	2+	N/A	0 (Pagana et al., 2025)	The patient probably has an elevated protein in the urine due to possible stress (Pagana et al., 2025).
Urobilinogen	4.0 mg/dL	N/A	0.1-1.0 mg/dL (Pagana et al., 2025)	The patient probably has increased urobilinogen because the liver is unable to recycle it into bile due to possible liver cirrhosis (Pagana et al., 2025).
WBC Esterase	Trace	N/A	Nondetected	The patient probably has

				traces of WBC esterase because of his infection in his tissues (Pagana et al., 2025).
UR Amphetamine	Detected	N/A	Nondetected	The patient probably has detected amphetamines because he stated he uses amphetamines.
UR Cannabinoid	Detected	N/A	Nondetected	The patient probably has detected cannabinoid because he stated he uses cannabis.
UR cocaine metabolite	Detected	N/A	Nondetected	The patient probably has detected cocaine because he stated he uses cocaine.

Previous diagnostic prior to admission (ER, clinic etc.) if pertinent to admission diagnosis	Previous diagnostic results and correlation to client admission	Current Diagnostic Test & Purpose	Clients Signs and Symptoms	Results and correlate to client diagnosis and condition
N/A (no diagnostics prior to admission)	N/A (no diagnostics prior to admission that	Ultrasound Left Duplex Lower Extremity Veins;	The patient's left lower leg has cellulitis that	The deep venous system of

Pagana, K. D., Pagana, T. J., & Pagana, T. N. (2025). *Mosby's diagnostic and laboratory test reference* (17th ed.). Mosby.

**Active Orders**

<b>Active Orders</b>	<b>Rationale</b>
Adult Diet, Diet type: Cardiac	The patient is on a cardiac diet due to his high blood pressure and hyperlipidemia.
IP Consult to Neurology- TeleNeuroHospitalist	The patient experiences bilateral upper extremity pain, possibly secondary to neuropathy.
Telepsychiatry Consult	The patient has an unhealthy coping mechanism such as cutting himself.
BMP AM x1	To assess the patient's fluid levels, kidney function, blood glucose, electrolytes, BUN, and creatinine.
CBC w/ diff AMx1	To assess the patient's red blood cells, white blood cells, and platelets due to his cellulitis

	and history of anemia.
Mag AM	To stabilize the patient's heart rhythms due to his history of low potassium and his current low potassium.
MRI C-spine w/o contrast	The patient experiences chronic pain. The care team suspected the patient was experiencing acute myelopathy of the cervical spine. Test was ordered but the patient refused.
XR Chest Single View	To rule out other diagnoses, the patient presented with a cough and fever.
Pulse oximetry	To monitor the patient's hemoglobin and oxygen to make sure oxygen enriched blood is circulating through the body.
Activity Order-as tolerated per mobility goal	To ensure the patient maintains his range of motion and good circulation.
Admission Weight	The patient's weight needs to be monitored due to his low sodium upon admission and today that can lead to fluid shifts in the body.
Insert/Maintain peripheral IV	The patient has multiple intravenous medications, 0.9% sodium chloride fluid, and an intravenous catheter will be needed if the patient needs resuscitation.

Intake and Output	To get a number of times the patient urinates, has bowel movements, and monitors how many milliliters of fluid he drinks and gets through his intravenous catheter.
Notify Physician (Specify)- Heart rate less than 50 beats per minute or greater than 120 beats per minute, respiratory rate less than 10 breaths per minute and greater than 30 breaths per minute, temperature greater than 101.5°F, urinary output less than 240 mL/8 hours, systolic blood pressure less than 85 or greater than 180, diastolic blood pressure less than 50 or greater than 105, pulse oximetry less than 90%, or new onset or worsening pain.	Monitoring vital signs can help detect early signs of worsening conditions and monitor that treatment is effective.
Notify Physician when prior to admission (PTA) medication review has been completed.	The nurse should review the patients prior to admission medications to complete medication reconciliation to prevent errors and ensure patient safety.
Nursing Communication: Hold antibiotics until BC and LA	The nurse should hold any antibiotics until blood cultures and laboratory analyses are complete to ensure the appropriate antibiotic is being given.
Nursing Communication: Offer prune juice if	To promote regular bowel movements and

available on the patient's diet.	help with constipation.
Nursing Communication: Please provide patient education to reduce and avoid constipation foods like red meat, fried or fatty foods, milk, and cheese.	The patient is on a cardiac diet due to his history of hyperlipidemia, low potassium, and high blood pressure.
Nursing Communication: Promote adequate fluid intake and encourage increased fluid intake if not on a fluid restriction.	The patient has low sodium levels and has dry flaky skin upon inspection and palpation.
Patient may shower (w/ Assistance)	So the patient is able to take a shower, but with assistance to prevent falls and promote safety since he has a low fall risk.
Vital signs per unit routine	Changes in vital signs are the first you see when the body has an infection. As well, the patient has a history of high blood pressure and low potassium.

### Hospital Medications (Must List ALL)

Generic/Brand	0.9% Sodium chloride/ Normal saline	Acetaminophen/ Tylenol	Aspirin EC/Bayer	Calcium carbonate /Tums	Cefazolin/Ancef	Fluoxetine/ Prozac
Dose, frequency, route	Continuous, IV, 100mL/hr	650mg, oral tablet, every 4 hours PRN	81mg, oral, daily	1,000mg chewable tablet, oral, every 8 hours PRN	1g, IV, every 8 hours	40mg, oral, daily

<b>Classification (Pharmacological and therapeutic and action of the drug)</b>	Pharmacological class: Intravenous repletishe r, electrolyte solution, and crystalloid fluid Therapeutic class: Nutrients, minerals, and electrolytes Action: To replenish fluid in the extracellular space, maintain electrolyte balance, and promote hydration (Jones & Bartlett Learning, 2024).	Pharmacological class: Nonsalicylate, paraminophenol derivative Therapeutic class: Antipyretic, nonopioid analgesic Action: To help with mild to moderate pain and reduce a fever (Jones & Bartlett Learning, 2024).	Pharmacological class: Salicylate Therapeutic class: NSAID Action: Inhibits platelet aggregation (Jones & Bartlett Learning, 2024).	Pharmacological class: Calcium salts Therapeutic class: Antacid, antihypertensive, antihyperphosphatic, antihypocalcemic, calcium replacement, cardiogenic Action: To provide antacid effects (Jones & Bartlett Learning, 2024).	Pharmacological class: First-generation cephalosporin Therapeutic class: Antibiotic Action: Interferes with the bacterial cell wall to kill the bacteria (Jones & Bartlett Learning, 2024).	Pharmacological class: 2nd Generation antidepressant Therapeutic class: Selective serotonin reuptake inhibitor (SSRI) Action: Inhibits the reuptake of serotonin. (Jones & Bartlett Learning, 2024).
<b>Reason Client Taking</b>	The patient is taking this medication to hydrate his body	The patient is taking this medication to help with his mild to	The patient is taking this medication due to his risk of a heart	The patient is taking this medication to help with his indigestio	The patient is taking this medication to treat his skin	The patient is taking this medication to treat his depressi

	and help with his dry skin.	severe pain when needed.	attack and stroke due to a blood clot because of his positive d-dimer.	n and heartburn when needed.	infection.	on due to his history of depressive disorder.
<b>Two contraindications (pertinent to the client)</b>	<p>1. High blood pressure (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Fluid volume overload which can present as dyspnea, adventitious lung sounds, or peripheral edema (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Liver impairment due to CT angiogram chest findings showing cirrhotic appearance in the liver (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Low fluid volume (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Use of enoxaparin medications (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Drinking alcohol (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Do not give if the patient's phosphate levels become low due to malnutrition or a history of alcohol use disorder (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Do not give if the patient's kidney function decreases due to infection, since calcium is excreted through the urine (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Use with caution in patients with a history of hypokalemia, as cefazolin may further deplete potassium levels (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Use with caution if the patient is also taking anticoagulants, there may be an increased risk of bleeding with</p>	<p>1. Low sodium levels (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Use of aspirin (Jones &amp; Bartlett Learning, 2024).</p>

					certain anticoagulants (Jones & Bartlett Learning, 2024).	
<b>Two side effects or adverse effects (Pertinent to the client)</b>	<p>1. High blood pressure (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Fatigue (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Low potassium (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Hepatotoxicity due to CT chest showing findings of cirrhotic appearance of the liver (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Short life span of red blood cells (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Decreased blood iron levels (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Warm sensation on skin (Jones &amp; Bartlett Learning, 2024)</p> <p>2. Peripheral vasodilation (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Superinfection (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Redness (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. Anxiety (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Decreased appetite (Jones &amp; Bartlett Learning, 2024).</p>
<b>Key nursing assessment(s) prior to administration</b>	1. Assess the patient for signs and symptoms of fluid volume overload prior to giving the medication	1. Assess for other medications that could also contain acetaminophen/Tylenol prior to administration (Jones & Bartlett Learning, 2024).	1. Prior to administration you would assess if the medication has a strong vinegar smell, and if it does	1. Prior to administration I would assess the patient's serum calcium levels (Jones & Bartlett Learning, 2024).	1. Prior to administration you would want to assess the patient's medication	1. Prior to administration you would want to assess the patient for suicidal

	<p>n (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Evaluate creatinine and BUN levels prior to giving the medication (Jones &amp; Bartlett Learning, 2024).</p>	<p>es &amp; Bartlett Learning, 2024).</p> <p>2. Assess the patient's ALT and AST to assess his liver function prior to giving the medication (Jones &amp; Bartlett Learning, 2024).</p>	<p>you would not give the medication (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Prior to administration you would assess if the patient is actively bleeding (Jones &amp; Bartlett Learning, 2024).</p>	<p>2024).</p> <p>2. Prior to administration I would assess and verify if the patient took any medications 1-2 hours before to prevent medication interactions (Jones &amp; Bartlett Learning, 2024).</p>	<p>history to prevent adverse reactions (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Prior to administration you want to assess the patient's creatinine levels to assess the patient's renal function (Jones &amp; Bartlett Learning, 2024).</p>	<p>ideation since he uses cutting as a coping mechanism (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Prior to administration you would want to assess the patient's blood glucose levels (Jones &amp; Bartlett Learning, 2024).</p>

route	daily	oral, 3 times a day	oral, 2 times a day PRN	oral, daily	oral, daily	oral, daily PRN
<b>Classification (Pharmacological and therapeutic and action of the drug)</b>	Pharmacological class: Water-soluble vitamin Therapeutic class: Vitamin B-complex, Hematopoietic agent Action: Helps in the formation of red blood cells (Jones & Bartlett Learning, 2024).	Pharmacological class: 1-amino-methyl cyclohexaneacetic acid Therapeutic class: Anticonvulsant Action: To manage postherpetic neuralgia (Jones & Bartlett Learning, 2024).	Pharmacological class: Piperazine derivative Therapeutic class: Anxiolytic, antiemetic, antihistamine, sedative-hypnotic Action: To relieve anxiety and tension (Jones & Bartlett Learning, 2024).	Pharmacological class: ACE inhibitor Therapeutic class: Antihypertensive Action: Lowers elevated blood pressure (Jones & Bartlett Learning, 2024)	Pharmacological class: thiazide diuretic (Jones & Bartlett Learning, 2024). Therapeutic class: thiazide diuretic/antihypertensive agent (Jones & Bartlett Learning, 2024). Action: Inhibits sodium chloride reabsorption within the kidneys, which reduces blood volume and increases urine	Pharmacological class: Mineral Therapeutic class: Electrolyte replacement Action: Works as an osmotic laxative by drawing water into the intestines to soften stool (Jones & Bartlett Learning, 2024).

					output (Jones & Bartlett Learning, 2024).	
<b>Reason Client Taking</b>	The patient is taking this medication due to his history of anemia.	The patient is taking this medication for his history of chronic pain.	The patient is taking this medication for his anxiety and his history of dermatitis.	The patient is taking this medication for his history of hypertension.	The patient is taking this medication because he has hypertension.	The patient is taking this medication for constipation when needed.
<b>Two contraindications (pertinent to the client)</b>	<ol style="list-style-type: none"> <li>1. Unknown cause of anemia (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Anticonvulsants (Jones &amp; Bartlett Learning, 2024).</li> </ol>	<ol style="list-style-type: none"> <li>1. Depression (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Suicidal thoughts (Jones &amp; Bartlett Learning, 2024).</li> </ol>	<ol style="list-style-type: none"> <li>1. Low potassium levels (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Drinking alcohol (Jones &amp; Bartlett Learning, 2024).</li> </ol>	<ol style="list-style-type: none"> <li>1. If the patient has a cough on this medication it should be discontinued (Jones &amp; Bartlett Learning, 2024).</li> <li>2. If the patient's potassium is high this should be held (Jones &amp; Bartlett Learning, 2024).</li> </ol>	<ol style="list-style-type: none"> <li>1. Use of medication with NSAIDs (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Low potassium levels (Jones &amp; Bartlett Learning, 2024).</li> </ol>	<ol style="list-style-type: none"> <li>1. Diarrhea (Jones &amp; Bartlett Learning, 2024)</li> <li>2. If the patient has electrolyte imbalances this can further the abnormality (Jones &amp; Bartlett Learning, 2024).</li> </ol>

<p><b>Two side effects or adverse effects (Pertinent to the client)</b></p>	<p>1. Depression (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Reddening of the skin (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. High blood pressure (Jones &amp; Bartlett Learning, 2024).</p> <p>2. Anemia (Jones &amp; Bartlett Learning, 2024).</p>	<p>1. ### Prioritize Three Hospital Medications

Medications	Why this medication was chosen	List 2 side effects. These must correlate to your client
1. Cefazolin/Acef	I chose this medication because the patient currently has an infection in his skin and has an elevated white blood cell count.	<ol style="list-style-type: none"> <li>1. Superinfection (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Redness (Jones &amp; Bartlett Learning, 2024).</li> </ol>
2. Potassium Chloride SA/ Klorco M	I chose this medication because the patient has low potassium and has a risk of	<ol style="list-style-type: none"> <li>1. Low potassium levels (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Low sodium levels (Jones</li> </ol>

	cardiac arrhythmias and cardiac arrest.	& Bartlett Learning, 2024).
3. Lisinopril/ Prinivil, Zestril	I chose this medication because the patient has hypertension which can lead to silent damage to blood vessels and organs.	<ol style="list-style-type: none"> <li>1. Arrhythmias (Jones &amp; Bartlett Learning, 2024).</li> <li>2. Low sodium levels (Jones &amp; Bartlett Learning, 2024).</li> </ol>

<p><b>Location:</b> Patient stated no pain.  <b>Severity:</b> 0  <b>Characteristics:</b> No characteristics due to the patient rating his pain at a 0.  <b>Interventions:</b> No interventions due to the patient rating his pain at a 0.</p>	
<p><b>IV ASSESSMENT:</b>  <b>Size of IV:</b> 20 Gauge  <b>Location of IV:</b> Left anterior proximal forearm.  <b>Date on IV:</b> 02/22/2026  <b>Patency of IV:</b> Fluids flow with no resistance.  <b>Signs of erythema, drainage, etc.:</b> No signs of drainage, redness, swelling, and tenderness.  <b>IV dressing assessment:</b> Transparent dressing.  <b>Fluid Type/Rate or Saline Lock:</b> 0.9% sodium chloride 100mL/hr continuous</p>	
<p><b>INTEGUMENTARY:</b>  <b>Skin color:</b> Patient's skin is usual for ethnicity upon inspection.  <b>Character:</b> Dry and flaky skin upon palpation.  <b>Temperature:</b> Warm upon palpation.  <b>Turgor:</b> Returns in less than two seconds.  <b>Rashes:</b> No rashes noted.  <b>Bruises:</b> No bruises noted.  <b>Wounds:</b> Bilateral lower arms have superficial self inflicted wounds that are scabbed over. Three self-inflicted wounds noted on the right lower arm. Six self-inflicted wounds noted on the left lower arm. Patient stated he has four cigarette burns on his right lower arm and then showed the nursing student.  <b>Braden Score:</b> 19  <b>Drains present:</b> Y <input type="checkbox"/>      N <input checked="" type="checkbox"/>  <b>Type:</b> N/A</p>	
<p><b>HEENT</b>  <b>Head/Neck:</b> Head and neck appear symmetrical to the patient's face. All lymph nodes are not palpable or tender. Trachea is midline with no deviation.  <b>Ears:</b> Bilateral ears have no lesions, lumps,</p>	

<p>or deformities upon inspection and palpation. Bilateral canals show no signs of pain or drainage. Patient responds well during conversation and shows good hearing skills.</p> <p><b>Eyes:</b> Bilateral sclera is white, bilateral cornea is clear, bilateral conjunctiva is pink, no visible drainage noted in bilateral eyes. Bilateral eyelids upon inspection appear pink, dry, and no lesions or discharge noted. Bilateral pupils are equal and round, <b>but do not accommodate to light.</b></p> <p><b>Nose:</b> Bilateral septum is intact and midline with no lesions, discharge, blood, edema, or discharge.</p> <p><b>Teeth:</b> <b>Yellow teeth with food particles noted upon inspection, and back bilateral teeth have cavities.</b> Mucous membranes are intact and moist with no lesions. Uvula and tongue are midline. The soft palate rises and falls symmetrically, and the hard palate is intact.</p>	
<p><b>CARDIOVASCULAR:</b></p> <p><b>Heart sounds:</b> S1 and S2 with normal rate and rhythm. S1 and S2 heard upon auscultating aortic, pulmonic, ERBs point, tricuspid, and mitral heart sounds.</p> <p><b>S1, S2, S3, S4, murmur etc.</b></p> <p><b>Cardiac rhythm (if applicable):</b> S1 and S2 were noted with no S3 or S4 murmurs.</p> <p><b>Peripheral Pulses:</b> Bilateral carotid, brachial, radial, femoral, popliteal, posterior tibial, and dorsalis pedis pulses were normal and graded 3+.</p> <p><b>Capillary refill:</b> Returns in less than two seconds on bilateral fingers. <b>Bilateral toes are unable to assess due to thickening on bilateral toenails.</b></p> <p><b>Neck Vein Distention:</b> Y <input type="checkbox"/> N X</p> <p><b>Edema</b> Y <input type="checkbox"/> N X</p> <p><b>Location of Edema:</b> No edema present.</p>	
<p><b>RESPIRATORY:</b></p> <p><b>Accessory muscle use:</b> Y <input type="checkbox"/> N X</p> <p><b>Breath Sounds: Location, character:</b></p>	

<p>Bilateral anterior and posterior lung sounds are non-labored and symmetrical upon inspection. Bilateral anterior and posterior lung sounds are clear throughout with no wheezes, crackles, or rhonchi noted.</p>	
<p><b>GASTROINTESTINAL:</b>  <b>Diet at home:</b> Patient states "I eat fried and fatty foods but not everyday, and I eat salads and other healthy foods like coleslaw."  <b>Current Diet:</b> Cardiac  <b>Is the Client Tolerating Diet?</b> -Yes  <b>Height:</b> 5 feet 5 inches  <b>Weight:</b> 166 lbs 10.7 oz  <b>Auscultation Bowel sounds:</b> Bowel sounds are active in all four quadrants.  <b>Last BM:</b> 02/23/2026 at 0726  <b>Palpation: Pain, Mass etc.:</b> Abdomen is soft, nontender, with no masses or pain noted upon palpation of all four quadrants.  <b>Inspection:</b> Abdomen is pink and usual for ethnicity.  <b>Distention:</b> No abdominal distention noted.  <b>Incisions:</b> No incisions noted on patient's abdomen.  <b>Scars:</b> No scars noted on patient's abdomen.  <b>Drains:</b> No drains noted on patient's abdomen.  <b>Wounds:</b> No wounds noted on patient's abdomen.  <b>Ostomy:</b> Y <input type="checkbox"/> N X  <b>Nasogastric:</b> Y <input type="checkbox"/> N X  <b>Size:</b> N/A  <b>Feeding tubes/PEG tube</b> Y <input type="checkbox"/> N X  <b>Type:</b> N/A</p>	
<p><b>GENITOURINARY:</b>  <b>Color:</b> Yellow  <b>Character:</b> Urine is clear with no foul odor present. Urine has no clots, mucous, or sediments noted. Urine does not appear</p>	

<p>cloudy upon inspection.  <b>Quantity of urine:</b> 900 mL  <b>Pain with urination:</b> Y <input type="checkbox"/> N X  <b>Dialysis:</b> Y <input type="checkbox"/> N X  <b>Inspection of genitals:</b> Genitals are intact, hair is observed upon inspection, and usual for ethnicity.  <b>Catheter:</b> Y <input type="checkbox"/> N X  <b>Type:</b> N/A  <b>Size:</b> N/A</p>	
<p><b>Intake (in mLs):</b> 490 mL</p> <p><b>Output (in mLs):</b> 900 mL</p>	
<p><b>MUSCULOSKELETAL:</b>  <b>Neurovascular status:</b> No cyanosis or clubbing noted. Thick bilateral toenails with thick flaky skin around the toes and on the sole of bilateral feet. Bilateral arms are dry, warm, and flaky. The left lower leg appears red, shiny, taught, and warm to the touch. The right leg is dry, flaky, and warm upon palpation. No pain, numbness, or tingling was noted in bilateral upper and lower extremities.  <b>ROM:</b> Active ROM  <b>Supportive devices:</b> Patient uses no supportive devices, due to him being a stand by assist.  <b>Strength:</b> 5  <b>ADL Assistance:</b> Y X N <input type="checkbox"/>  <b>Fall Risk:</b> Y X N <input type="checkbox"/>  <b>Fall Score:</b> Universal/Low  <b>Activity/Mobility Status:</b> Stand by assist  <b>Activity Tolerance:</b> Patient tolerates activity well, and requires a stand by assist.  <b>Independent (up ad lib):</b> Patient is not independent, and is a stand by assist.  <b>Needs assistance with equipment:</b> Patient requires a shower chair.  <b>Needs support to stand and walk:</b> Patient needs support when standing and walking due to stand by assist mobility status.</p>	

<p><b>NEUROLOGICAL:</b>  <b>MAEW:</b> Y X N <input type="checkbox"/>  <b>PERLA:</b> Y <input type="checkbox"/> <b>NX</b>  <b>Strength Equal:</b> Y X N <input type="checkbox"/>  <b>If no -</b> Legs <input type="checkbox"/> Arms <input type="checkbox"/> Both <input type="checkbox"/>  <b>Orientation:</b> Alert and oriented x4  <b>Mental Status:</b> Patient has normal cognition, follows commands well, and no long or short term memory deficits noted. The patient is attentive to the nursing student and answers questions appropriately.  <b>Speech:</b> The patient's speech is clear.  <b>Sensory:</b> Patient feels touch upon palpation all through his body.  <b>LOC:</b> Patient is alert, awake, and answers questions well.</p>	
<p><b>PSYCHOSOCIAL/CULTURAL:</b>  <b>Coping method(s):</b> Patient states he cuts himself to cope with stress.  <b>Developmental level:</b> Generativity vs. Stagnation  <b>Religion &amp; what it means to pt.:</b> The patient states he is a Christian and he has no religious concerns.  <b>Personal/Family Data (Think about home environment, family structure, and available family support):</b> Patient states he does not feel safe at home due to people coming in and stealing his money and personal items, and breaking items in his home. The patient stated he has no family support, but his neighbors help him out when needed.</p>	

### Discharge Planning

**Discharge location:** Upon discharge, the patient is going home and will care for himself.

**Home health needs:** The patient is in need of home health to assess and monitor his infection after discharge, and prevent an infection from coming back. The patient is in need of home health to assess and monitor his mental health due to his history of depressive disorder.

The patient is in need of home health to evaluate and monitor his unhealthy coping mechanism of cutting himself to ensure he starts a healthy coping mechanism and does not have suicidal ideations.

**Equipment needs:** Upon discharge, the patient will need a shower chair.

**Follow up plan:** I would follow up each week with the patient to assess if his new coping mechanisms work. I would follow up each week to assess the patient's mental health to assess for early signs of decline. I would follow up each week with the patient to assess and evaluate how well his skin care regimen is working. I would follow up to evaluate the patient's infection of the tissues each week by marking his tissue infection site with a border and evaluate it slowly improving over time.

**Education needs:** I would educate the patient about different coping mechanisms to help with stress than cutting himself. I would educate the patient about having a skin care regimen to help with his dry skin and prevent another infection of the skin due to cuts or scrapes. I would educate the patient about monitoring his infection and contacting his provider when his tissue infection moved past the border created on his leg.

### Nursing Process

**\*Must be NANDA approved nursing diagnosis and listed in order of priority\***

Nursing Diagnosis	Rationale	Outcome Goal (1 per dx)	Interventions (2 per goal)	Evaluation of interventions
<ul style="list-style-type: none"> <li>● Include full nursing diagnosis with "related to" and "as evidenced by" components</li> <li>● Listed in order by</li> </ul>	<ul style="list-style-type: none"> <li>● Explain why the nursing diagnosis was chosen</li> </ul>			

priority – highest priority to lowest priority pertinent to this client				
1. Infection related to a breach in skin barrier, as evidenced by elevated white blood cell count and diagnosis of cellulitis (Phelps, 2023).	I picked this nursing diagnosis because the patient presents with an elevated white blood cell count and an infection in the skin.	The patient's white blood cell count and differential I will be within normal limits upon discharge (Phelps, 2023).	1. Help the patient with washing their hands before and after meals and using the bathroom, to prevent further infection (Phelps, 2023). 2. Maintain standard precautions, to prevent further infection and spread of bacteria (Phelps, 2023).	I would evaluate the progression of the patient's infection and their white blood cell count to assess and monitor the treatment regimen. I would evaluate how the client maintains his skin integrity throughout treatment by washing his hands before and after meals and using the bathroom.
2. Ineffective coping related to the patient's history of depressive disorder, as evidenced by the patient utilizing cutting himself as a coping mechanism (Phelps, 2023).	I picked this nursing diagnosis because the patient has a history of depressive disorder and chronic pain, and currently takes gabapentin to stabilize his mood. The client uses an unhealthy coping skill such as making superficial cuts in his arm.	The patient will talk about resources for crisis prevention and management upon discharge (Phelps, 2023).	1. The patient will use relaxation practices like deep breathing, guided imagery, and meditation (Phelps, 2023). 2. Use a caring, warm, nonjudgmental manner (Phelps, 2023).	The client demonstrated relaxation techniques such as deep breathing using the teach back method to show understanding. The client stated he would put these relaxation techniques into practice whenever he felt depressive thoughts.
3. Impaired skin integrity related to his electrolyte imbalances, as evidenced by his	I chose this nursing diagnosis because the patient has low sodium and	The patient will identify triggering	1. Instruct the patient in a skin care regimen (Phelps, 2023).	I would evaluate the patient by assessing if the patient does not experience any

skin being dry and flaky. (Phelps, 2023).	calcium and these electrolytes can lead to fluid shifts in the body and dental problems. The patient appeared with yellow teeth with food particles and back bilateral teeth cavities.	factors and relate them into a skin care routine upon discharge (Phelps, 2023).	2. Encourage the patient to talk about his feelings about his skin condition (Phelps, 2023).	new skin breakdown or any other skin complications upon discharge (Phelps, 2023).

<b>Nursing Process Prioritization</b>	<b>Rationale</b>
1. Infection	I picked this for my nursing diagnosis because the patient already has an infection and an elevated white blood cell count that needs to be monitored or it can lead to an infection in the blood.
2. Ineffective coping	I picked this for my nursing diagnosis because the patient uses cutting himself as a coping mechanism and has a history of depressive disorder, which puts the patient at a higher risk for suicidal ideation. As well, when the patient cuts himself it increases his risk of infection.
3. Impaired skin integrity	I picked this for my nursing diagnosis because with the patient showing low calcium and sodium it can lead to fluid shifts in the body

	and cause edema, just like low calcium can lead to dental and bone problems.
