N442 Clinical Journal for Triage Day

I have completed the TurbulentSky and ICS training course from FEMA.gov as a clinical experience. It is always a trouble as usual, take me a while to figure it out how to do the course. The etvlabs website was kind of confusing at the first when I use, then I finally figure it out how to progress. I actually really like the course, it provides 360 degree views of disaster area with a lot of detailed scenes, it looked real and I had pretty good concept of it. They also had slides and video lecture provide more detailed information, as well as practical quizzes. Overall, it was a good experience to learn what is the disaster triage scenes is look like, although, all the actors do not like really hurt or suffering from their wound or trauma.

The FEMA learning course, on the other hand, was just slides to read and have the final exam to take. I did not have technological issues; however, it took me a while to complete the course since it was just self-learning activity. I learned the many details about ICS, the information was very in depth and straight forward, and the final exam was very hard as well. As a clinical experience, I did not think it was practical since it only provides written information to read, although, contained few videos. The overall experience was okay, I personally liked etvlabs learning because it was more effective and practical. I wish I could have done this triage day in the school.
