Sigma Nurse Management Modules

Ethical Principles

Activity 1:

The ethical principles include, autonomy, veracity, confidentiality, fidelity, beneficence, justice, and omniscience. I can always see them on the clinical floors. We as a nurse requires to protect patient's confidentiality, that will including do not talk about the patient other than private space, turn off the computer screen when leave the desk. We respect patient's autonomy and veracity by tell them the truth about their physical condition and their risks, to help them make their own decisions. If we promise to come back with medications they requested, we will be return per their request, and that is an example of fidelity.

Activity 2:

I think the most important principle as a nurse is nonmaleficence, which is do no harm to the patient. As a nurse, we are in the position to protect the patients. To be a nurse and do no harm requires competence, skills, and good performances. IV insertion is a basic skill for a nurse to acquire, however, it is the skill that requires tons of practices. Before we acquire the skill, we are always in the spot to hurt someone, although it was not our intention to do.
