Topic:	Pathophysiology	Manifestations (Including lab findings)	Nursing interventions	Patient Education
<p><b>Chronic Kidney Disease (CKD)</b></p> <p>- Progressive, irreversible kidney disease.</p>	<p>The pathophysiology of CKD is not fully understood. However, it is believed to be caused by prolonged acute inflammation that is not specific to organ. Therefore, CKD has subtle systemic symptoms.</p> <p>Patients in the earlier phase can show no signs or symptoms of having the disease. Also, in the early phase of CKD it can cause significant damage to kidneys.</p>	<p>As CKD progresses, manifestations become apparent.</p> <ul style="list-style-type: none"> <li>• Nausea</li> <li>• Fatigue</li> <li>• Depression</li> <li>• Lethargy</li> <li>• Involuntary leg movement</li> <li>• Intractable hiccups</li> <li>• Decreased skin turgor</li> <li>• HTN</li> <li>• Anemia</li> <li>• Pallor</li> <li>• Weakness</li> <li>• Dizziness</li> <li>• Tachypnea</li> <li>• Fluid overload</li> <li>• Dysrhythmia</li> <li>• Slurred Speech</li> <li>• Tremors</li> </ul> <p><b>Labs:</b>            BUN &amp; Creatinine: Increased            Electrolytes:            Na &amp; Ca- Decreased            K, Ph, Mg- Increased            CBD (H&amp;H): Decreased            UA: Hematuria &amp; Proteinuria            Urine Specific Gravity- decreased</p>	<ul style="list-style-type: none"> <li>• Monitor Irregular findings</li> <li>• Monitor Vascular access</li> <li>• Assess and monitor Peritoneal dialysis insertion site</li> <li>• Obtain detailed past medical history- Medications.</li> <li>• High carb, moderate fat diet</li> <li>• Prepare for hemodialysis</li> <li>• Encourage them to ask questions</li> <li>• Administer medications as prescribed</li> <li>• Balance activity and rest</li> <li>• Monitor Urine output characteristics</li> <li>• Monitor Vitals- blood pressure may be increased or decreased</li> <li>• Monitor daily weight and weight gain</li> </ul>	<ul style="list-style-type: none"> <li>• Restrict dietary sodium, potassium, phosphorous and magnesium.</li> <li>• High carbohydrate, moderate fat diet</li> <li>• Educate on hemodialysis, peritoneal dialysis, and hemofiltration</li> <li>• Encourage them to ask questions</li> <li>• Drink at least two liters of fluids a day.</li> <li>• Smoking cessation</li> <li>• Limit alcohol intake</li> <li>• Use diet and exercise to manage weight and prevent/control hypertension and diabetes.</li> <li>• Adhere to medication guideline to prevent kidney damage</li> <li>• Annual check for albumen in the urine.</li> <li>• Take the FULL-COURSE of antibiotics</li> <li>• Limit intake of NSAIDS</li> </ul>
