Case 1: Ms. PS

Ms. PS is a 24 yo G2P0100 at 32.4 weeks gestation admitted for severe preeclampsia. She has a history of a classical Cesarean Delivery at 24.2 in a pregnancy complicated by HELLP syndrome with a subsequent neonatal demise. At admission, her fetal tracing had a baseline of 135 with minimal variability, no accelerations, and no decelerations 4 hours ago. She has received one dose of Betamethasone for fetal lung maturity approximately 3 hours ago. Ultrasound reveals a fetus with 4th percentile growth and a lagging abdominal circumference. There is absence of end-diastolic flow in the umbilical artery. She is currently on magnesium sulfate at 2 g/hr, and has received one dose of intravenous Labetolol, 20 mg, approximately two hours ago. Her current blood pressure is 153/97, pulse 86, temperature 99.4, respirations 18, O₂ saturation is 96% on room air. Her deep tendon reflexes are 3+/4, her lungs are clear, and she has had 250 ml of urine output in the last 4 hours. Her urinalysis reveals 3+ proteinuria. Her liver enzymes are within normal limits and her platelets are 112. She presently denies headache, visual changes, shortness of breath, chest pain, or right upper quadrant pain. Below is her current fetal tracing:
