a) Total = 21 Prime #s

b) Both 197 and 199 are Prime!

Prime Factorization of

20) 35,657

$$\begin{array}{r}
 197 \swarrow \quad \searrow 181 \\
 35,657 \\
 \hline
 = 197 \cdot 181
 \end{array}$$

22) There cannot be three consecutive prime numbers. Every other number ~~beginning~~ ~~from~~ counting number is even, therefore is divisible by 2, and considered composite - except 2, 3 which are consecutive primes

24) Since the divisibility test for 2, 4, 8 incorporates an addition digit to the end of the numbers consecutively, then divisibility test for 16 will be - last 4 digits to form a number divisible by 16.

- 456,882,320 -  $\frac{2320}{16} = 145$

26. The Fundamental Theorem of Arithmetic -
