

I sincerely believe that the quality of the material will continue to improve. In fact, I would say that

progress will accelerate because as Matt Tidley said; "the ideas started to get to have intercourse. There are more and more inventions, so there will be more lapses in the creative processes because the pool of ideas is much larger and different. For Enlightenment fairly new areas of assiduity such as the branch of computer science will bring new reliefs

and will continue to fascinate scientists to explore the limits of computers.

A specific illustration would be IBM's quantum design. They have only a slight idea of what that thing is suitable to do and accomplish, but the provocation of numerous people made that design possible. One group presumably invested only with unborn returns in mind but I'm sure there were scientists really fascinated by exploring and especially expanding what is possible with the IBM Quantum.

What I mean is that I suppose over time progress will accelerate exponentially, because there will always be a provocation. Humanity has tasted progress and wants more, people . . . want more rest time so inventions will be made for an easier daytime life, the population is . . . growing and lack of coffers will be a problem as well as living space. Time will add reasons for progress and in time creativity will flourish. Humans born into the elaboration and in the habit of not being born feel as if they are "in the future."

I was born before the invention of the smart phone and lived my non-age outdoors on the streets and the playground. My parents gave me my first cell phone when I was 11 years old, but nowadays I see kids in kindergarten with the latest iPhone model and, sometimes

in fact entire tablets. I feel that progress but for them it's normal. Looking back in time , . . . people used to travel months to cross the Atlantic and I just got there in about 10 hours. This seems completely insane nowadays.

Surely there are ways to limit the improvement. Distractions like politics , . . . Rapacity and faith. All of these are presumably the ABC reasons for conflict around the world. The process of realizing that we, humanity, are on the same side and have the . . . same claims will have an effect on the fluidity of progress. Inequality, racism , . . . etc. are a distraction from wisdom, inventions and progress. People who waste their time

and studies on these negative motives are like a contagion. Due to globalization and advanced communication the whole world is connected and can almost be assumed as a computer.

and can almost be assumed of it as a computer. Billions of intelligences are connected, forming a computer and processing

. all the time. With wars and conflicts it is overheating like a telephone and the latest of progress intrudes. Humanity has to resolve its nebulousness of belonging. A great Nyack principle Leaves the effects better than it plants them.
