Frame Your World

Covid-19, a disease that took the world by storm, while at the same time spreading so rapidly killing millions of people in less than a year, was giving the name one of the most deadliest diseases to ever been known. Leading back to 2019 where the first report of Covid-19 was first detected in Wuhan, China setting off a deadly pandemic throughout the world. The origins of the disease suggest that "SARS-CoV and MERS-CoV originated in bats. SARS-CoV then spreads from infected civets to people, while MERS-CoV spreads from infected dromedary camels to people." (National Institute of Allergy and Infectious Disease, Mar 16, 2022

 The first victim who was reported to have Covid-19 was a 55 year old male from Hubei province. The virus then quickly spread through Asia, Europe, Africa, Australia. North and South America. Traveling was put on hold because they had to find ways to control the virus from rapidly spreading. It was believed that animals were not affected as much as humans so it was spread through animals and produce, so the world government took action forcing citizens to quarantine so the spread would be minimized.

Looking back to other diseases, the spread of covid was looked at as a very deadly virus even though we had the resources to make multiple cure to contain the virus while still having cases of people dying, meanwhile in the earlier days where they didn't had the materials to contain the virus they had to protect their citizens which resulted with a large population of people dying. The spread of a global disease can affect the industrial world

because as you know we share good with different nations so trading would have to be put on hold until they find a way to detain and control the disease, leading to most countries having less goods.
