

One of the biggest commodities that every American and maybe every individual all over the world depends on are coffee/coffee beans. Above I have attached a map that was posted on The Ohio State University website by Amanda McNutty, which maps out the coffee beans travels before getting distributed within the buyer's distribution centers. In which ending with the purchasing and consumption of the product from the public.

Many of the United States and Canadian coffee corporations like Dunkin Donuts, Starbucks and Tim Horton seek to outsource its products and supplies to give its customers a different coffee experience to beat its competitors.

The map displays where the coffee beans have grown/harvested, where it's been processed, exported, imported, roasting and distributing phases.

Growing/Harvesting is done in Kenya , Brazil, Colombia and Vietnam. The processing stage is done in countries like Costa Rica, Kenya. Majority of the Exporting and Importing are done in

countries like the United States (i), and Brazil (e). The Roasting phase are happening in Japan, the United States and Europe. Distribution happens at the buyer's of the coffee business distribution warehouse in which they will send the products to all their cafe locations to be enjoyed buy their customers
