Organizing a database for a company/shop:
Connecting the learnings of Database Design with the programming 2 class. I would like to be able to organize information in a Database so that they are easily accessible and they would actually be helpful for a company/shop.

A Game:
I think it would be cool if I would be able to program a simple interactive game and if possible even with a GUI. Also making something move based on the user's keyboard input would be great. If the game has a point system or something similar it should have Highscores saved in a Database

Multifunctional program:
Creating a portal where you can use different helpful programs. In this case, I would like to include a lot of programs from the internet as we learned in the Final project from the sharks, that programming today almost never is about programming from scratch but copying and pasting and making different programs work together. If possible I would love to include a Database in this program too.
