

Types of Research Examples Assignment

LaQuandra Z. Gooden

Alliance University

**Abstract 1:** This research is qualitative. The research mentions how it interviewed 8 university students, which is case study type research. In addition, it was more in depth because the researchers tried to understand and know the students' thoughts and feelings. Lastly, it was eight students meaning it was a sample, and not a large population. Most qualitative researchers consist of a sample.

**Abstract 2:** This research is quantitative because they used a survey, a sample survey at that. In addition, their data was generalized. Also, the data results were numerical. Lastly, it was Quasi-Experimental design because they use existing groups.

**Abstract 3:** This research was quantitative, and used Quasi -Experimental design because it was an existing group, there was no random assignment. In addition, the researchers used surveys, and the results were in numerical data.

**Abstract 4:** This research is quantitative because it displays a comparison between health behavior and general health status. In addition, it was descriptive and correlational. Lastly, the data was measured on an interval via scale.

**Abstract 5:** This is quantitative research that is correlational, and the information is a generalization. Furthermore, due to using one group of women, this research can be considered a Quasi- Experimental design, and the group already exists.

**Abstract 6:** This research is quantitative, and their data consisted of interval scale. In addition, Quasi-Experimental design because they used an existing group, no random assignment was assigned, and it only consisted of one group which was mothers through pregnancy. Furthermore, it was generalized, not in depth.
