Advantages and disadvantages of scientific and technological development

Just in 2021, this new vocabulary network of Yuanyu Province entered our lives and became a topic that people kept talking about. The transmission of ideas and advanced healthy world experience seen by the ancient TV color love seem to be no longer a dream. According to BBC Xinyang, Yuan Yufu refers to 30 quasi-spaces for a network connection. Users can enter the Huiyu world through headphones, mobile phones or game consoles and have various sinking experiences. Users have their own digital avatars or incarnations in the leather world. After drinking this digital body, they communicate with common users, explore new questions, and create new content. The concept of Yuanyu Province is that it can be developed for a long time and become an interactive space for people to socialize, play, work and learn. It's really amazing! This gives us a new sense of the rapid development of technology. In just a few decades, we have witnessed that science and technology show a new look. In our current era, the development of science and technology has reached unprecedented development and progress. There is no denying that technology has also completely changed our lives. It can be said that our women's life and technology are simply inseparable. That's the problem. What advantages and disadvantages will the development of science and technology bring us?

First of all, let's talk about the "benefit" of scientific and technological development. There is no denying that the development of science and technology has brought a lot of benefits to human life. As students, during the epidemic, because of the Internet, we can achieve the goal of suspending classes and not stopping learning through online. Shangban Brigade can also be close to the Internet to stay at home during the epidemic. In order to protect their health and go out less, people can also buy their daily necessities through online shopping. Imagine that if estrus occurs in an era of underdeveloped science and technology, what kind of situation will Shisheng be in? In addition, through the Internet, the original summer miscellaneous transfer program can be easily solved through screen conversion. Many people also sell online to earn income. The development of science and technology can be said to completely segment our trade form and lifestyle, and also bring great convenience to our lives. Take online shopping as an example. Through software such as Taobao, we can search for the items we want to be greedy for at home, and easily get to the store we want through the page. Not only that, on the Internet, the selection of items is full of eyesight and very diverse. Online shopping not only saves time and effort, but also the items on the Internet are often more convenient than the current one! This is killing three birds with one stone! In addition, with the increasing development of artificial intelligence, smart lights, smart electric wishes, smart sweepers, intelligent monitoring and other items have come to our daily life at home. These intelligent tools have brought a lot of convenience to our lives. Some more advanced intelligent products can even be controlled by voice control, such as smart lights, which can be switched with just the commands on the sound. It's really

convenient! Science and technology products have indeed greatly improved people's living standards and quality of life.

In addition, the development of science and technology has also brought many great changes to the territory of transportation and communication. I am convinced that we can't deny that today, the distance from business can't affect the relationship between people. Even if relatives and friends are separated, as long as you have a mobile phone, you can tell their care and greetings through video and communication. Because of the research and development of scientific and technological products, the sickness of travelers studying abroad can be eliminated, and parents can worry about their children. Family members who work far away from other countries can take a plane to enjoy the happiness of family while taking a foreign country while on vacation, so as to bridge the gap between them. Similarly, during the epidemic, when we know that a personal friend is diagnosed at a high level, we can easily give each other warm care and wait through cloud videoconferencing or WeChat calls. Because of the development of science and technology, public transportation is also becoming more and more developed. People can quickly reach their destinations by light rail without facing the nightmare of traffic jams. The world's fastest maglev train is in mainland China. The speed of this train reaches 600 kilometers per hour, which can be said to come faster than planes. It's amazing! The development of sharp skills allows people to reach their destinations quickly and easily, thus saving not only time and money but also energy.

Admittedly, the development of science and technology does bring us countless benefits, but at the same time, it will also bring many bad butterflies. Although scientific and technological products can connect with people in the same places, they are not universally used. With the development of science and technology, there will be less and less heart-to-heart communication between people. Many people feel it. The world is more wonderful than the world of observation. They have become "low-headed people" in the online world of dragons. People's questions lack sincere exchanges, and the relationship is getting more and more tense. When we saw Xinyang when our parents looked at their mobile phones on the road and their children crossed the road and entered the car to wish Xinyang, when we swallowed a young man because of our parents. He is prohibited from playing video games to add new sun to his parents, which further confirms the serious harm of rice brought by technology products under the condition of abuse. This is the situation that we often see around us. Maybe this is on the dinner table in your family. There is no longer real interaction or laughter between them. More often, we see a family looking down at the phone, and even siblings are not at the dining table, but watching telegram wishes in the living room. If this is the case If it is maintained, the gap between family members is bound to grow larger and wider, and it is easy to cause unnecessary disputes. It makes the originally harmonious family restless.

In addition, although the development of science and technology brings convenience, it will worsen the problem of environmental pollution. In order to develop industrial technology, trees have been cut down and factories continue to rise. In many cases, people often pay too much attention to the profits brought to everyone by industrial science and technology, and ignore the serious problems of environmental pollution and ecological and environmental imbalance. Because the black smoke excluded by these factories greatly increases the content of carbon dioxide in the atmosphere and indirectly worsens the greenhouse effect, which even causes climate change. The melting of glaciers in the North and South Poles, the composition of acidic substances in black smoke will lead to an increase in the air pollution index and acid rain. The wastewater discharged by the industrial territory leads to serious water pollution problems, resulting in the death of aquatic organisms. Large-

scale deforestation for development will cause many creatures to lose their homes. After research, glaciers have melted faster in recent years, with an average annual loss of 31% more ice and snow than 15 years ago. Compared with 2000-2004, 71 billion tons of ice and snow melted every year from 2015 to 2019. This research also confirms the harm caused by scientific and technological development to nature. If the environmental pollution caused by industrial science and technology is not taken seriously, the consequences will be unimaginable in the long run.

Finally, if scientific and technological products are not well used by the world, they will contribute to many criminal incidents. If it happens, it will lead to the spread of more false information. On the Internet, people often don't need to do what they do. Responsible, some people who live up to their responsibilities love to spread false rumors and defamatory comments on social media, which has led to many disputes, and some netizens like to spread false news on Facebook or other social media, which has caused panic among the masses. Technology products make criminals' means more and more high-end. Internet users can disguise themselves with anonymous identities, defraud money through various means, and even steal important messengers of other common network users. Moreover, the Internet makes it easier for offenders to "destroy corpses" and make it more difficult for them to be captured. In addition, according to online data, an average of tens of thousands of crimes occur every day. And most of its criminal methods are related to the current new technology. In particular, gun crimes make ordinary people unable to prevent. If they are not prevented, they will inevitably cause the loss of security of the people.

To sum up, water can carry a boat or overturn the boat. The use of technology can be said to be a double-edged sword. The original intention of scientific and technological development is to change people's lives and benefit the people. Therefore, enjoying the infinite convenience brought by scientific and technological products is based on the premise of shrewd use. We should learn to make good use of scientific and technological products and become the masters of science and technology, not become slaves of science and technology. I am convinced that if everyone is willing to use scientific and technological products and cherish scientific and technological products, they will know how to go. In this era of vigorous development of science and technology, it has become an intelligent user of science and technology, so the "pro advantages" brought by scientific and technological products in this era must be greater than their "disadvantages".
