Spread of Covid

Spread of the Black or Bubonic Plague

In comparing the epidemic of Covid-19 and the Bubonic we are able to see the difference in how we now travel and at what pace the world moves. Covid was spread around the globe in just a few months, contaminating new centuries every few days. While it took the Plague years to spread to just the surrounding areas. We are able to see what countries are more closed off in the modern world or the countries that are more frequently traveled to. During the time of the Plague the disease spread from one place to another almost migrating across Asia into Europe and Africa. In this first era of the Plague it only ever stayed in the same relative part of the world that was composed of the most populated areas. Covid however spread to every corner of our globe starting and spreading quickly within the highly populated areas.
