There is a gap between rich and poor students in New York State's schools. Understanding the percentages of money given to charter versus public schools is essential. Discovering this would help solve the problem of financial inequity in public schools. Contributing to this research, New York can understand better what the government is giving or the lack thereof towards public schools. If there is proof in this research that there is a bigger gap between public schools and charters in the finances, there needs to be a solution to this problem. This report will show New York how to solve this problem.

Through the research on New York's charter schools. A percentage of resources goes to charter schools in the form of in-kind services. Secondly, New York charter schools can be "divided into those that are co-located within district school buildings and those that are not co-located". (Maloney & Wolf, 2017) Here, the logistics of where public schools will be spoken about in this paper.
