Audio Production

The knowledge that is required for audio production is very important in this field. I think that having a wide understanding of the fundamentals and skills needed is a common fact in being successful and producing quality workstations and income. The video demonstrated paramount tips that set the tone for a versatile sound engineer. About two years ago I had the opportunity to sit in a training about sound engineering and I was introduced to decibels and the importance of understanding the frequency of sound. However, I do not think that this line of business is easy and knowing the fundamentals is practical and technical in a sense. In the early 1980's the digital audio workstation was combined with hardware/software which made it user friendly and time efficient to be able to edit, mix and select mastering functions in one software and I think that was a great move for the industry. Lastly, the information shared for this weeks' lesson has inspired me to learn more about audio production.
