

Some primary differences between my daily life in the 21st century and those who lived 1000 years ago are things like technology, lifestyles, and values some hold in their lives. Some examples we see when comparing the two when discussing the Agrarian world and the modern world are technology, as we see all the technological advancements that have been made in the past 1000 years. I feel that as of now we have a higher advantage than those in the Agrarian world because for example today, we have advanced farming machinery, modern transportation like cars, planes, and trains, and technologies such as the internet, smartphones, and computers that have entirely changed the way we live and work. As we move on to the lifestyles we see now when comparing the two lifestyles, people in the Agrarian world lived in small, rural communities and were generally self-sufficient. They grew their food, made their clothes, and lived off the land. Whereas in today's modern world, you don't usually see someone growing their foods or making their clothes because now all you have to do is go to a store and they have it all for you ready to just buy from. I feel that as time went by, things for us became easier than it was for those in the Agrarian world who had to work hard for what they needed in their daily lives.

Lifestyle I feel has changed from 1000 years ago to now in the 21st century because considering we evolved with technology, making it easier for us to gather resources. The differences in technology and lifestyle have most definitely led to differences in values. For example, I feel as though my life isn't at the best when it comes to living with other fortunate ones, but it is better than how those who lives 1000 years ago because of the resources I have available to be now like going to school, getting an education and having that technology to learn things that are out of my scope which can help me develop in a different way than those back then developed. We both developed in different ways, but that doesn't mean they didn't succeed

at what they had going on because they were they just had to work much harder than we in the modern world have to. In the Agrarian world, people valued community, family, and tradition. Where those in the modern world, value more of an individualistic concept as well as innovation, and progress.

Some of the technology we use today differ from those used in the Agrarian eras in some ways. Things like the printing press, electricity, and medicine existed 1,000 years ago. The dissemination of knowledge was fundamentally altered when the printing press was created in the fifteenth century. Because of a lack of the necessary resources, books were previously hand copied, exceedingly expensive, and scarce. The vast production of books made possible by the printing press increased public access to knowledge. Speaking of electricity that later developed, it was first found in the 19th century and completely altered modern life. As a result, innovations like light bulbs, household items, and other technology that improved the quality of life were made possible. In my perspective, a life without electricity today would be practically impossible because so many things in our contemporary world—including water heaters, lights in our homes, and other necessities for daily living—depend on electricity to function. Another thing that is considered to be used for daily life in our modern society is medicine, just as it was necessary for people living in the agrarian era to develop their methods of healing because they lacked access to such resources. People in the agrarian period sometimes turned to homemade medicines or superstitions since they had very little access to medical care. We now have cutting-edge medical procedures and technologies that have increased our lifespans and enhanced our general health.
