Week 4 - 10 Point Assignment

This week of work was very entertaining and interesting with a number of different useful information that can be used in the future. Throughout the video we learn about the fundamentals of audio recording. This can be very useful for those who are trying to become successful with a music career. Basic information such as knowing what audio recording is, what type of hardware is needed, inputs and outputs connections, what microphones do and which microphones should be used. Audio recording is the capturing of a sound source, the conversion from analog to digital information, and the storage of that information. Throughout the video it gets very detailed and talks about very little important things such as what signal-to-noise (SNR) ratio is. SNR compares the level of a desired signal to the level of background noise. It involves noise from the background or even noise that is going through the microphone. I personally do not see myself having a musical career but it definitely made me realize a lot about music. I noticed that the music industry is way bigger than you can imagine and also brings a lot of people together as well as many outsiders. It is very hard to create a song with all of the little fine details that are being put together just to perfectly put a song together. From here on out every song I listen to I will think to myself that the hard work that was put into this was great and definitely took a lot of energy and effort from multiple people.
