

Research & Writing Assignment

Network connections

Even though I don't have a Jacket from Indonesia, I do have a handbag from there. To bring the handbag into my home, the following network connections were likely needed: transportation network connections to move the handbag from the factory in Indonesia to a port, then shipping network connections to transport the handbag from the port to my country, USA, and finally logistics network connections to move the handbag from the port to the store from which I bought it.

To bring an iPhone or cell phone from China into my home, the following network connections were likely needed: transportation network connections to move the phone from the factory in China to a port, then shipping network connections to transport the phone from the port to my country, Customs network connections to clear the iPhones through customs and ensure compliance with local regulations, and finally, logistics network connections to move the phone from the port to the store I purchased it.

At home, we drink only Poland spring water. A separate delivery network would need to be established to bring Poland Spring water into someone's home. This could involve working with a local distributor or setting up a delivery service directly with Poland Spring. Finally, a payment network would allow customers to pay for the Poland Spring water delivery service. This could involve setting up a billing system or using an existing payment platform like PayPal or any other form of payment.

My son loves chicken tenders. Chicken tenders are typically sourced from poultry farms, processed at a meat processing facility, and shipped to grocery stores or restaurants. A complex supply chain network ensures that chicken tenders are available for purchase. Some grocery stores may offer home delivery services, allowing customers to order chicken tenders online and deliver them to their doorstep. Alternatively, food delivery services like Uber Eats, Grubhub, and DoorDash can deliver chicken tenders from a restaurant.

Some of my shoes are made in Italy, and Italian shoes are typically manufactured in Italy. In this case, the supply chain network would involve sourcing the raw materials, designing and manufacturing the shoes in Italy, and shipping them to the USA. Importing the shoes into the USA requires working with customs brokers, freight forwarders, and other import-related businesses to ensure that the shoes are adequately cleared for entry into the country. The shoes must be shipped from the retailer or importer to the customer's location. This could involve a

network of couriers, mail carriers, or shipping companies that handle the transportation and delivery of the shoes. When the shoes arrive in the USA, they must be cleared through customs, which may involve paying import duties or taxes or providing additional documentation to comply with customs regulations.

My son and I only wear Havaiana flip-flops from Brazil. Havaiana flip-flops are typically manufactured in Brazil. In this case, the supply chain network would involve sourcing the raw materials, designing and manufacturing the flip flops, and shipping them to the USA. Importing the flip flops into the USA requires working with customs brokers, freight forwarders, and other import-related businesses to ensure that the flip flops are cleared adequately for entry into the country. The flip flops must be shipped from the retailer or importer to the customer's location. This could involve a network of couriers, mail carriers, or shipping companies that handle the transportation and delivery of the flip-flops. When the flip flops arrive in the USA, they must be cleared through customs, which may involve paying import duties or taxes or providing additional documentation to comply with customs regulations.

Network connections impact people's daily lives in many ways that would not be possible today without them enabling people to communicate instantly and easily, no matter where they are in the world. Social media, email, instant messaging, and video conferencing are just ways people use network connections to stay in touch. Network connections have transformed the way people work and learn. With remote working and online education becoming more popular, network connections have made it possible for people to work and study from anywhere in the world. Network connections have enabled people to access entertainment content from anywhere. Streaming services, online gaming, and social media are just ways people use network connections for entertainment. Network connections have impacted healthcare with the rise of telemedicine and remote patient monitoring. People can now consult with doctors and healthcare providers remotely, which has made healthcare more accessible and convenient for many.

Summary: The world would be vastly different without a global network. My life, and any human life, would be significantly impacted in many ways. With a worldwide network, access to information would be unlimited, making it easier to stay informed about what's happening worldwide. International trade would be severely limited, as it relies heavily on the transportation, communication, and information networks that exist today. The ability to travel would be significantly reduced without a global network, as there would be limited transportation options and higher costs associated with travel. With little trade and economic growth, fewer job opportunities would be available, particularly in industries that rely on

international trade. The global network has enabled collaboration and the sharing of ideas across borders, which has led to significant advances in science, technology, and other fields. With it, innovation would be much faster and more localized. The lack of a global network would impact healthcare access, as medical professionals and resources may not be as easily accessible. Access to education would also be affected without a worldwide network, as international educational opportunities would be limited. The lack of a global network would lead to a much more isolated and insular world, with limited trade, travel, communication, and innovation opportunities. The lack of a worldwide network would lead to a more secluded, less connected, and less developed world. It limits opportunities for growth, knowledge, and personal development and leads to a lower standard of living for many people.
