Week 5 - 10 Point Assignment

This week's discussion post was very interesting and actually helped me understand a different side of the music industry that I've always wondered about in my head. I've always wondered why the same song may sound different on different platforms, sometimes on certain platforms it may sound louder than others. Throughout the video they talked about how loudness in music turned out to be. In some genres it worked out perfectly but in others it didn't come out as expected or simply did not fit well. All services have the same thing in common and that is that they all automatically normalize volume. Loudness is more complicated than you think when it comes to mixing music you can not simply just turn it all the way up because it will not turn out how you think it will. As technology changes techniques change and that's why it becomes more and more complicated than most think.
