

The Maya tribe had all kinds of incredible technologies that they used such as their writing system, it was very sophisticated which used hieroglyphs to record their history, religion, and astronomical observations. This writing system is one of the few fully developed writing systems in the pre-Columbian Americas. The second technological function that they used was a calendar. Maya developed a complex calendar system, which incorporated the movements of the sun, moon, and planets. This calendar was essential to their agricultural practices and religious ceremonies. The third thing that they used was mathematics that they developed, including the use of zero and a positional numbering system. They used this system to make astronomical observations and to track the passage of time. Another form technology that the Maya's had was their own architecture, they built their own temples, palaces and they built their own pyramids by the mathematics that they knew how to do to ensure that the buildings would not crumble. The last thing that they had was agriculture, they did crop irrigation and crop rotation.
