It is difficult to predict with certainty whether the Incan empire could have expanded far enough to ward off the Spanish invasion, as there were a variety of factors that could have influenced the outcome. However, there are a few factors that could have potentially strengthened the Incan society and helped it resist the Spanish conquest.

One factor that could have helped strengthen the Incan empire was the development of a more centralized and stable government. At the time of the Spanish invasion, the empire was already facing internal challenges such as succession crises and rebellions, which weakened its ability to effectively resist a foreign invasion. If the Incan rulers had been able to establish a more stable and centralized government, they may have been better equipped to resist the Spanish.

Another important factor would have been the ability to develop and maintain alliances with neighboring territories and ethnic groups. The Incan empire was known for its sophisticated road and communication systems, which allowed it to maintain control over its vast territory. By developing strong relationships with neighboring groups, the Incas may have been able to pool their resources and resist the Spanish invasion more effectively.

Ultimately, it is difficult to say with certainty what factors would have been necessary to secure the Incan empire from European takeover, as the circumstances of the time were complex and multi-faceted. However, it is clear that a combination of political stability, strong alliances, and a strong economy and military would have been important factors in helping the Incan empire resist the Spanish conquest.
