2. For those who constantly drink alcohol will build up a tolerance to it and will need more of it to feel the alcohol effects. Some people become dependent on Alcohol because it helps them with not having to deal with anxieties, like a coping mechanism for the things they must deal with. Alcohol also reduces tension. Long term problems that are associated with alcohol abuse are the damage of your organs in which can cause a person to get chronic and/or serve illness, they can also suffer from delirium tremen (explain it). They can also experience confusion, hallucinations, extreme nausea and vomiting. Many individuals who use therapy to help their addiction AAA, self help groups, rehabilitation, aversion therapy, etc.

3. Heroin is an opioid (made from opium poppy and morphine) and it is very addictive. It activates dopamine and serotonin, while the symptoms are nausea and vomiting, heavy legs and arms, etc. Cocaine is a stimulant that was made from coca plant, it is also addictive and blocks dopamine. Some of the symptoms are anxiety, dilated pupils, muscle twitches. The similarities these two shares are they block certain neurotransmitters, affect the heart, can be used in a similar way, and are bad for you.

13. The problem of college binge drinking is that many students end up getting arrested, dropping out of school or get expelled, low academic performance, arrested, assaulted, death etc. Aside from them getting chronic illnesses, they can also become independent to alcohol and become addicted to it. Depending on what age the college student is, it can affect the brain development since it isn't developed until 25. As a result, it will affect how the structure of your brain.

17. I think that medical marijuana has benefits for those who need it because this isn't the first case where I had heard it had helped the person heal from their chronic illness. Though I am not a big fan of the whole ideal of marijuana, if it help them recover like what happened t Angel. Why not use it? I know the way they make Marijuana is different compared to the 70s, so I am not sure what they added or taken away. But from what I had seen so far it seem ok.

19. Early ejaculation is when a male ejaculates within a minute of being intimate. It could be due to biological (genetics, imbalance serotonin levels, nerves, etcetera) and/or psychological (inexperience, have anxiety, and etcetera) reasoning. In fact, it affects about 30 percent of the male population. Female orgasmic disorder is when a women has a hard time or is unsuccessful to reach orgasm. Due to many reasons like psychological (trauma, depression, menopause, toxic relationship, and so forth), sociocultural (cultures disproving the women having an orgasm), and biological (health problems, medications, menopause, and so on). It affects about 25 percent of women. Lastly, vaginismus is when a female's outer third layer experiences contraction without it being voluntary. It can cause a female to be afraid of intercourse, etc.

18. The male hypoactive sexual desire disorder and female sexual interest/arousal disorder is a lack of or no interest in sex. Factors that can be the cause of this is the indivial age lowering

their sex drive. Another example is lower testosterone levels is chemical connection to this disorder.

32. Sexting is sexual description through text message. I consider this behavior normal because of hormones and all. However those who participate in this action should be careful with it and of age because you cannot unsend it, and you have to watch out for it and who you send it to. Make sure that you know what you're doing and if you really want to do it, also be aware of what could happen.

33. I think drugs should be use for correcting sexual disorders, as society progresses, I feel like there are ways to enhance lifestyles etc. As a results theses medication that were targeted for medical use are being used for personal reasons. For an example the product Ozempic, in which it is those who have type 2 diabetes. But because of the sides effects (weight loss), people who don't have medical issues use it for weight loss. And depending on how many products are made, those who need them can't get it. I think that this research shows that products that target sexual needs and motivations are highly markable. I don't think that drugs should remove all negative emotions because it could cause more harm than good, and mentally an emotionally effect the body.
