

World Civ II

Samara Phillips-Hines

Film response : Global warming

Major Environmental Problems Documented in this Film:

1. Global warming and climate change are causing numerous environmental problems that are documented in the film. Some of the most significant problems include rising sea levels, ocean acidification, extreme weather events, melting glaciers and ice sheets, and changes in precipitation patterns. These environmental changes are leading to the loss of biodiversity, changes in ecosystems, and the displacement of human populations.

How the Film Illustrates Altering of the Environment in the Last Century:

2. The film illustrates how humans have altered the environment in the last century by contributing to global warming and climate change through the burning of fossil fuels, deforestation, and other activities that release greenhouse gases into the atmosphere. The film highlights how human activities have led to significant changes in the Earth's climate, and how these changes are causing numerous environmental problems.

Long-term Dangers Projected in the Film and What Can Be Done to Stop Them:

3. The film projects numerous long-term dangers associated with global warming and climate change, including the loss of biodiversity, water scarcity, food shortages, and the displacement of human populations due to rising sea levels and extreme weather events. To stop these dangers, it is essential to reduce greenhouse gas emissions by transitioning to clean energy sources and implementing policies to reduce carbon emissions. Additionally, promoting sustainable practices such as reforestation, regenerative agriculture, and the circular economy can help mitigate the impacts of climate change and promote a more sustainable future.
