## Film Discussion on Global Warming

1) What are some of the major environmental problems documented in this film?

One of the major environmental problems we are facing is the rise in temperature over the last few years. We also see sea levels are rising in certain places. We have also witnessed a significant amount of droughts.

2) What are some of the long-term dangers projected in the film? What can be done to stop this danger?

The use of oil, gas, and coal can be long-term dangers if we continue to burn it the way we do. We will witness wildfires like we have never seen before costing billions of dollars in damages. One of the things that can be done to stop this danger is cut the usage of carbon down to 2.7 F. We also need the solar radiation management.
