Global Warming

Some of the Long-term dangers projected in the film Include extreme weather patterns, rising sea levels, disruption of ecosystems, and a decrease in biodiversity. These dangers are projected to lead to more extreme weather events, such as floods, droughts, and heat-waves, which could cause significant damage to infrastructure, agriculture, and human health.

In order to address these long-term dangers of global warming, steps must be taken to reduce carbon emissions and transition to renewable energy sources. This transition must be supported by governments and corporations, who must regulations that incentivize companies to reduce their emissions and invest in renewable energy.

The film also shows the connection between the corporate sphere and networks and hierarchies, which can create tensions when corporations do not take responsibility for their actions. For example, the film shows how a corporation's decision to deforest an area or pollute a river can have a negative impact on the local community, who may not have the resources or power to challenge the corporation's actions. This tension is further

exacerbated by the lack of regulations and oversight that exists in many countries, which can allow corporations to act with impunity.
