Description Frame - The Life Cycle of a Whale

Humpback whales have many interesting features. First, they have baleen plates, instead of teeth, that hang from the roof of their mouth and look like a comb with frayed ends. This allows them to catch foods like tiny krill that get trapped in the frayed ends. Second, they sometimes make bubbles that surround and trap their prey like a huge net. Last, they have the longest pectoral fins, or flippers of any whale which can be up to 15 feet long.
